**Step 1:**  
Introduce yourself...– few words about  
identification, authentication & authorization

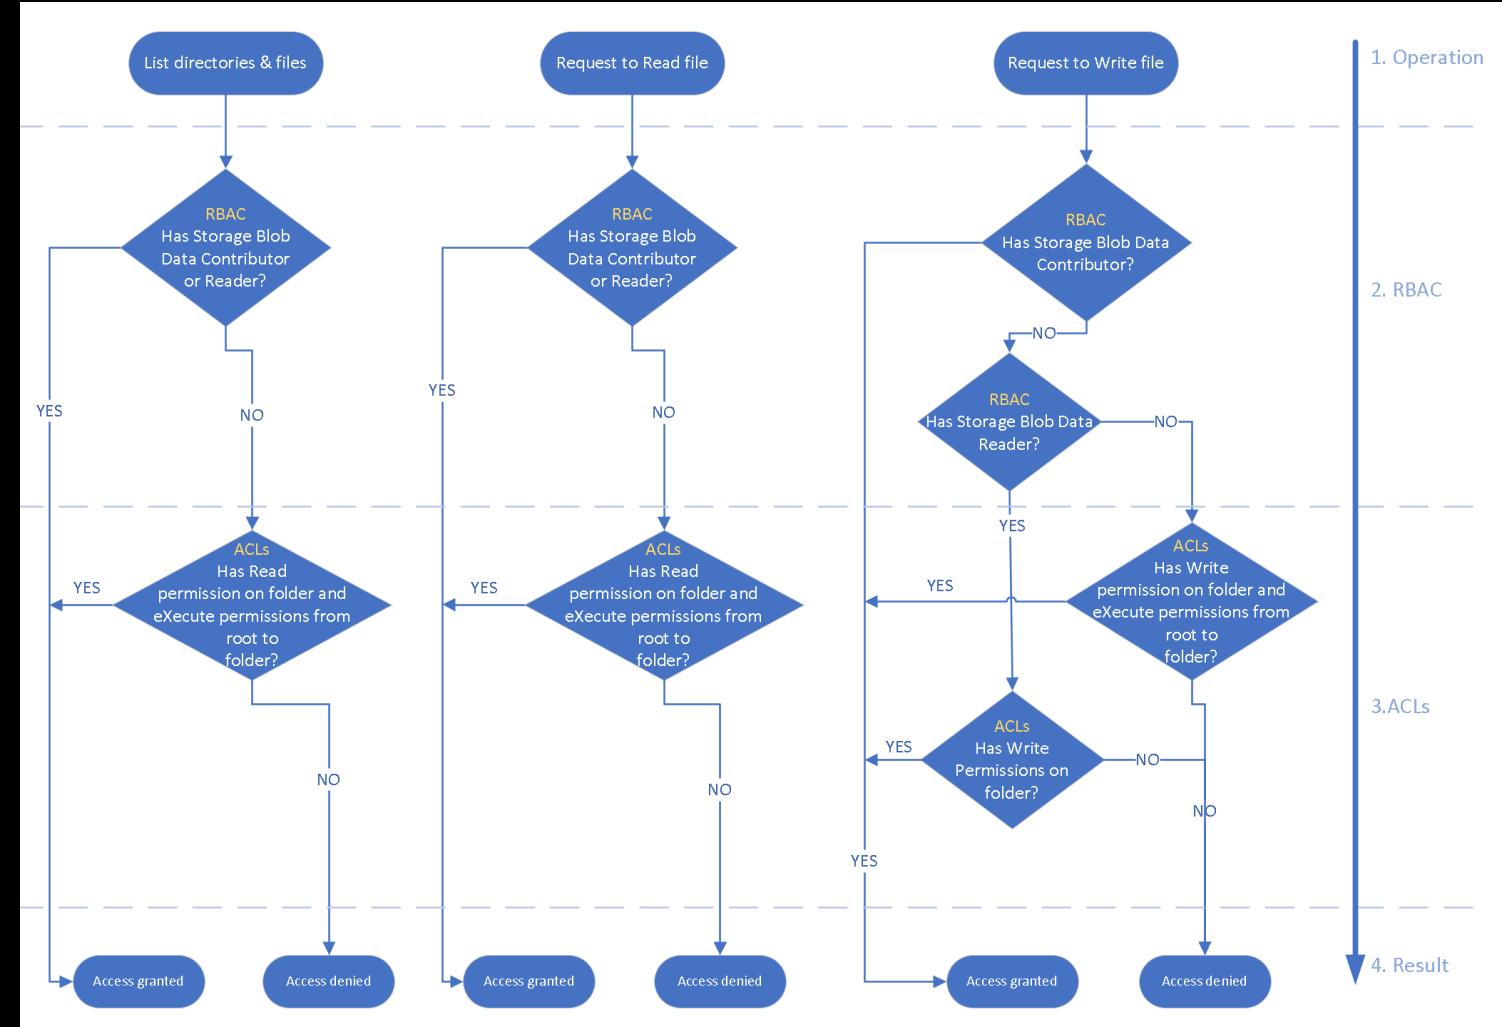

# Introduce yourself...– few words about identification, authentication & authorization

- Overview
  - Manage user identities in one location
  - Enable access to data services with Azure Active Directory user identities and groups
- Benefits
  - Alternative to database level authentication
  - Limits proliferation of user identities across databases
  - Allows password rotation in a single place
  - Enables management of database permissions by using external Azure Active Directory groups
  - Eliminates the need to store passwords

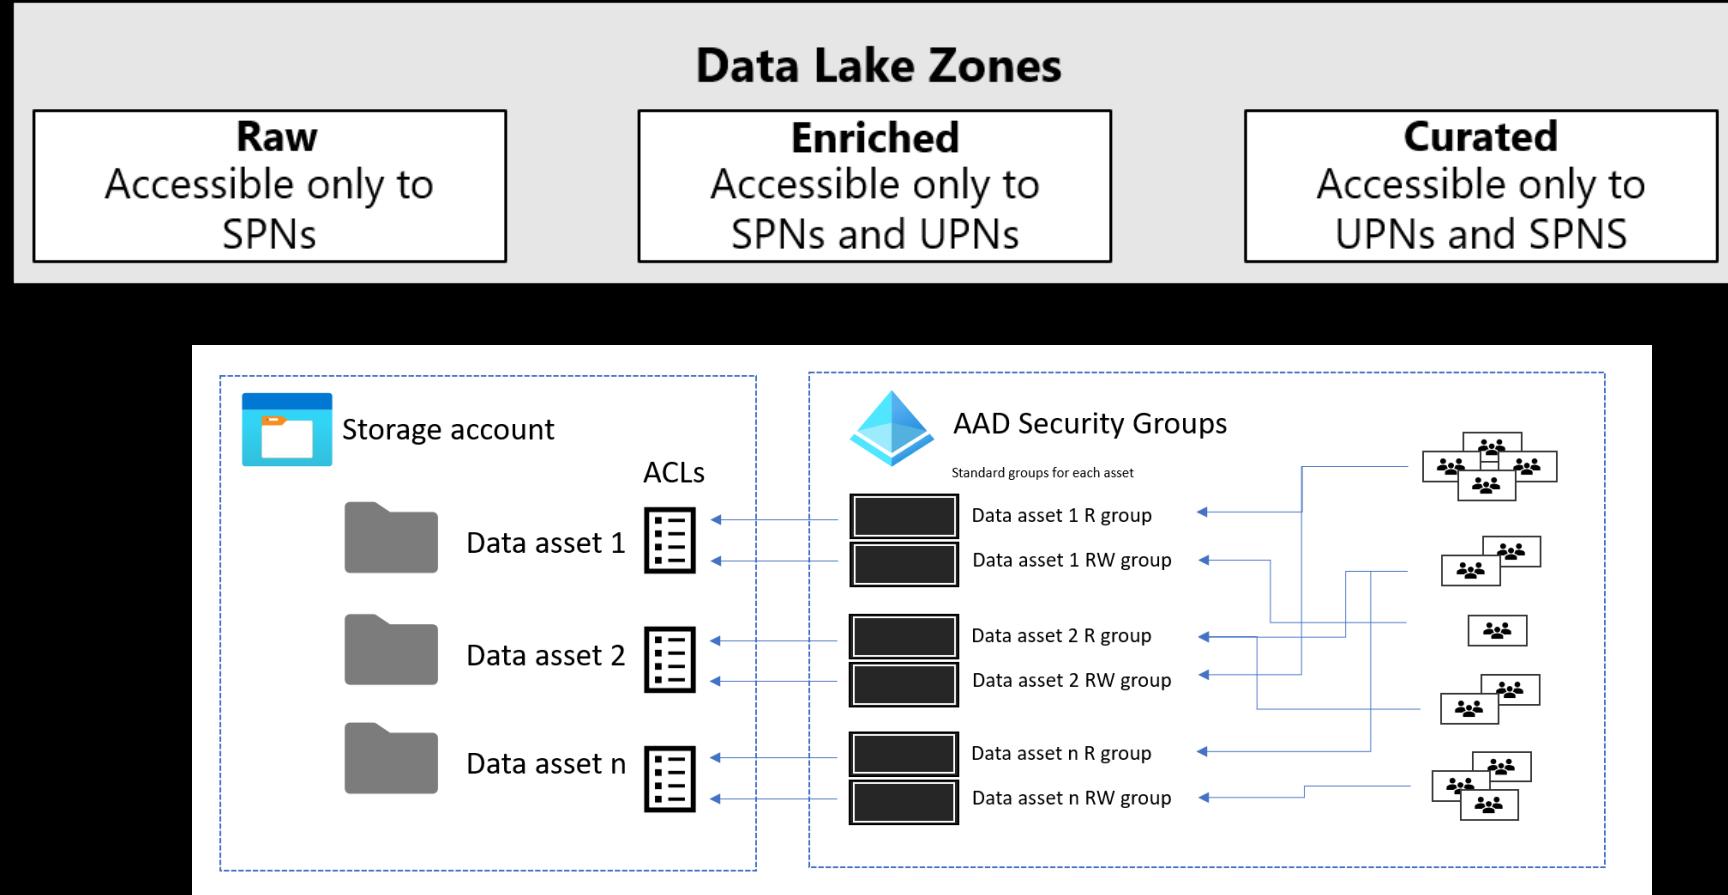

# Introduce yourself...– few words about identification, authentication & authorization | Azure Data Lake Storage

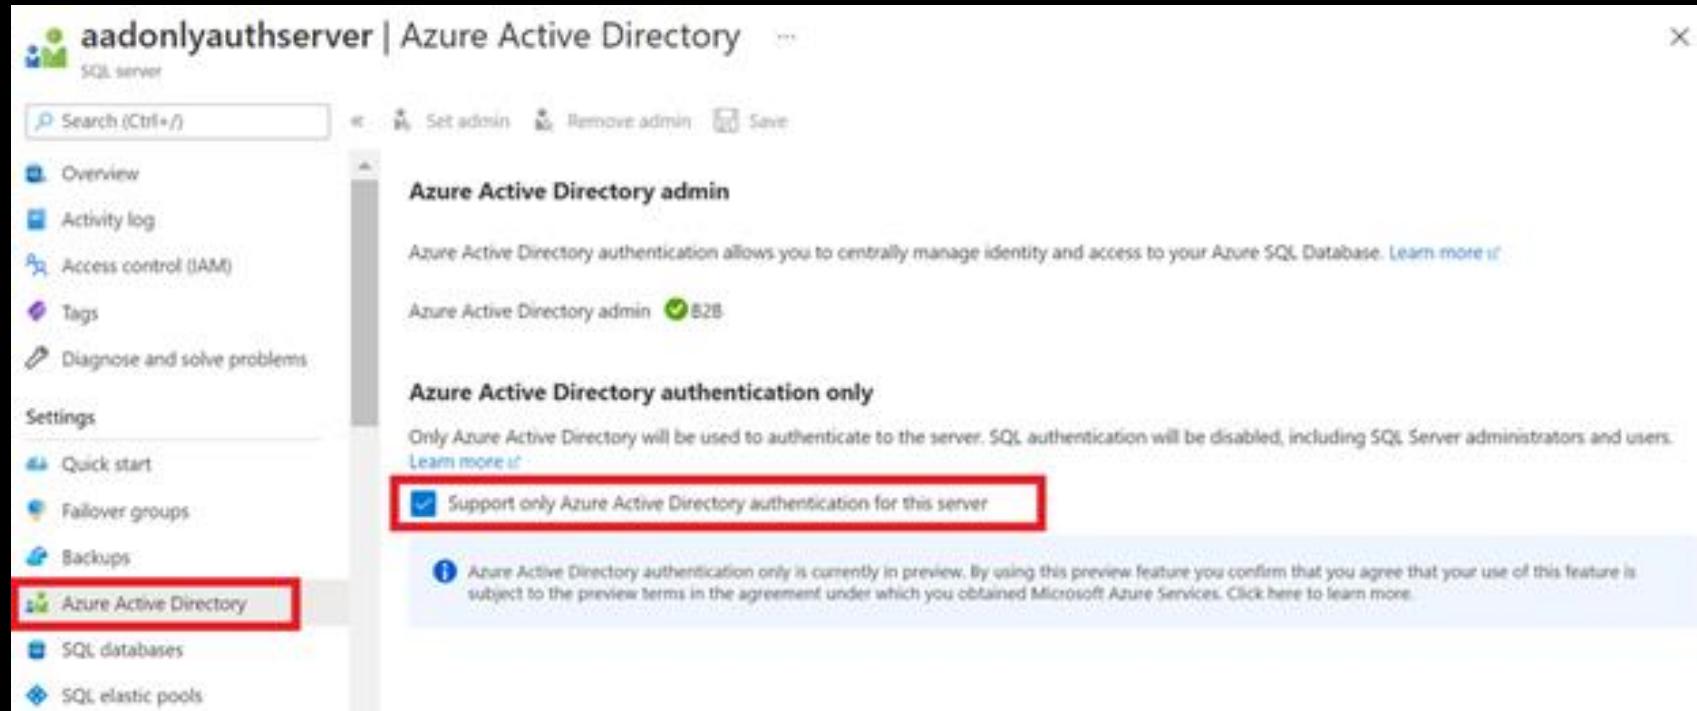

[Access control and data lake configurations in Azure Data Lake Storage Gen2 - Cloud Adoption Framework | Microsoft Docs](#)

# Introduce yourself...– few words about identification, authentication & authorization | Azure Data Lake Storage

# Introduce yourself...– few words about identification, authentication & authorization | Azure SQLDB | Synapse Analytics

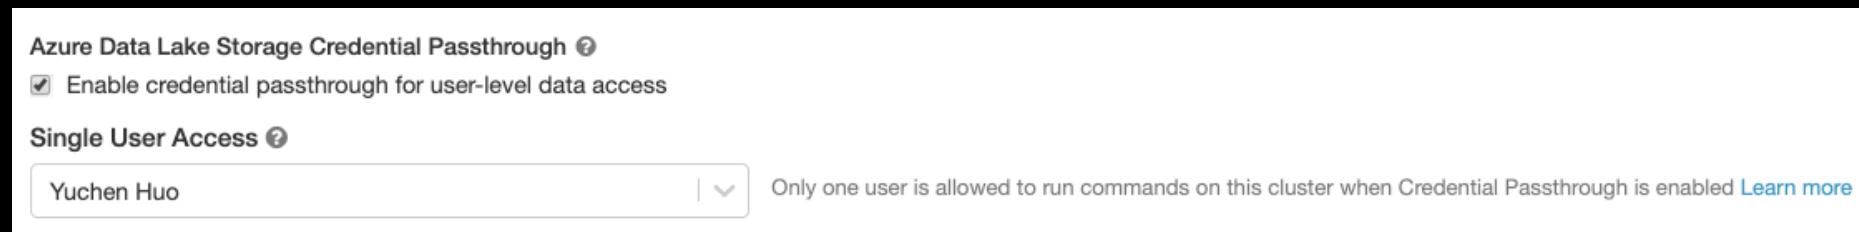

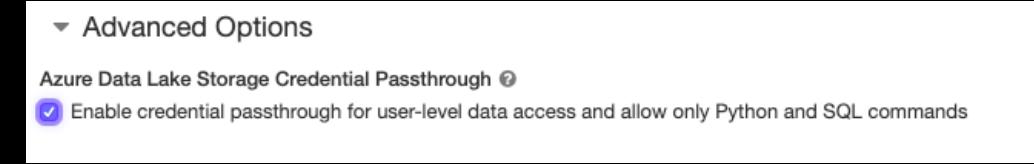

[Azure Active Directory only authentication for Azure SQL - Microsoft Tech Community](#)

# **Introduce yourself...– few words about identification, authentication & authorization | Azure Databricks**

- Accessing ADLS from an Azure Databricks cluster **requires a service principal to be made** with delegated permissions for each user. The credentials should then be stored in **Secrets**. This creates complexity for Azure AD and Azure Databricks admins.
- **Mounting a filesystem to DBFS allows** all users in the Azure Databricks workspace to have access to the mounted ADLS account. This requires customers to set up multiple Azure Databricks workspaces for different roles and access controls in line with their storage account access, thereby **increasing complexity**.
- When assessing ADLS, either directly or with mount points, users on an Databricks cluster share the same identity when accessing resources. This means there is **no audit trail of which user accessed** which data with cloud-native logging such as **Storage Analytics**

# Introduce yourself...– few words about identification, authentication & authorization | Azure Databricks

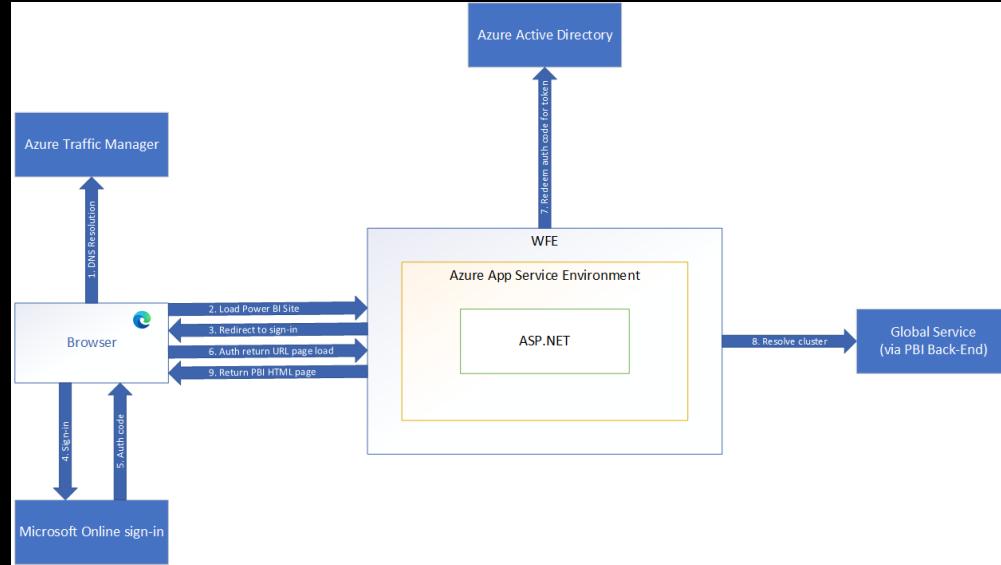

- **Azure AD Credential Passthrough** allows you to authenticate seamlessly to Azure Data Lake Storage from Azure Databricks clusters using the same Azure AD identity that you use to log into Azure Databricks.
- Your data access is controlled via the ADLS roles and ACLs you have already set up and can be analyzed in Azure's Storage Analytics.

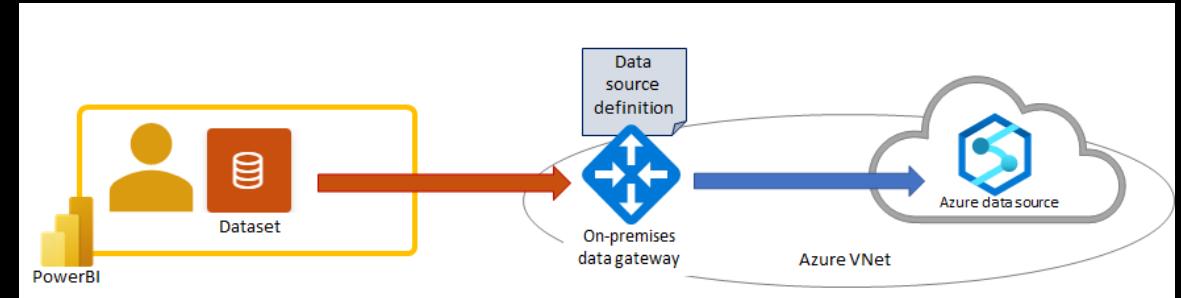

[Simplify Data Lake Access with Azure AD Credential Passthrough \(databricks.com\)](https://databricks.com)

# Introduce yourself...– few words about identification, authentication & authorization | Power BI

Power BI Portal

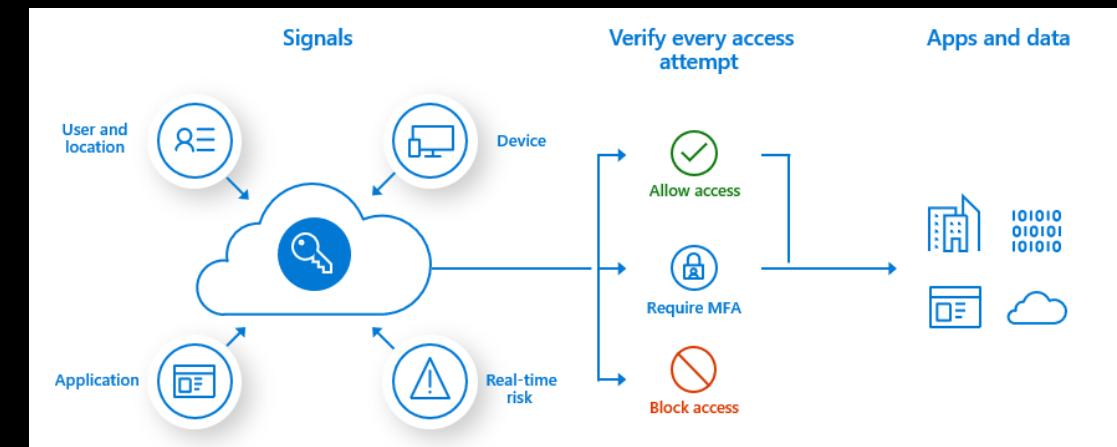

Dataset Credentials / Power BI Gateway SSO

!!! A Power BI admin must enable the Azure AD Single Sign-On (SSO) for Gateway tenant setting in the Power BI admin portal !!!

# Introduce yourself....– few words about identification, authentication & authorization | Power BI MFA & Conditional Access

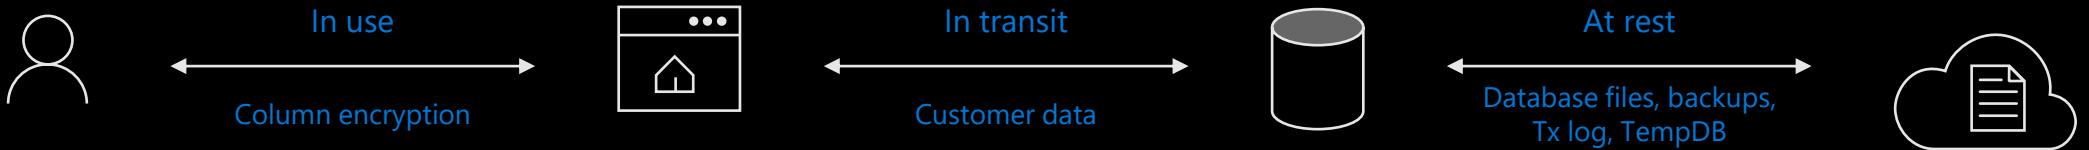

- Any user who wants to use Power BI has to adhere to 2 factor authentication
- You can only connect to Power BI when you are on the corporate network
- You can only connect from machines that are domain joined
- You can only connect from a machine that is complaint with the network policy
- You can only use Power BI when you are part of a special AD group

**Step 2:**  
**Is my data safe...- the one about secure data store**

# Is my data safe... - the one about secure data store | Azure SQL

Data encryption	Encryption technology	Customer value
In transit	Transport Layer Security (TLS) from the client to the server	Protects data between client and server against snooping and man-in-the-middle attacks <small>*Azure SQL Database is phasing out Secure Sockets Layer (SSL) 3.0 and TLS 1.0 in favor of TLS 1.2</small>
At rest	Transparent Data Encryption (TDE) for Azure SQL Database	Protects data on the disk Key management is done by Azure, which makes it easier to obtain compliance
In use (end-to-end)	Always Encrypted for client-side column encryption	Data is protected end-to-end, but the application is aware of encrypted columns This is used in the absence of data masking and TDE for compliance-related scenarios

# Is my data safe...- the one about secure data store | Azure Storage

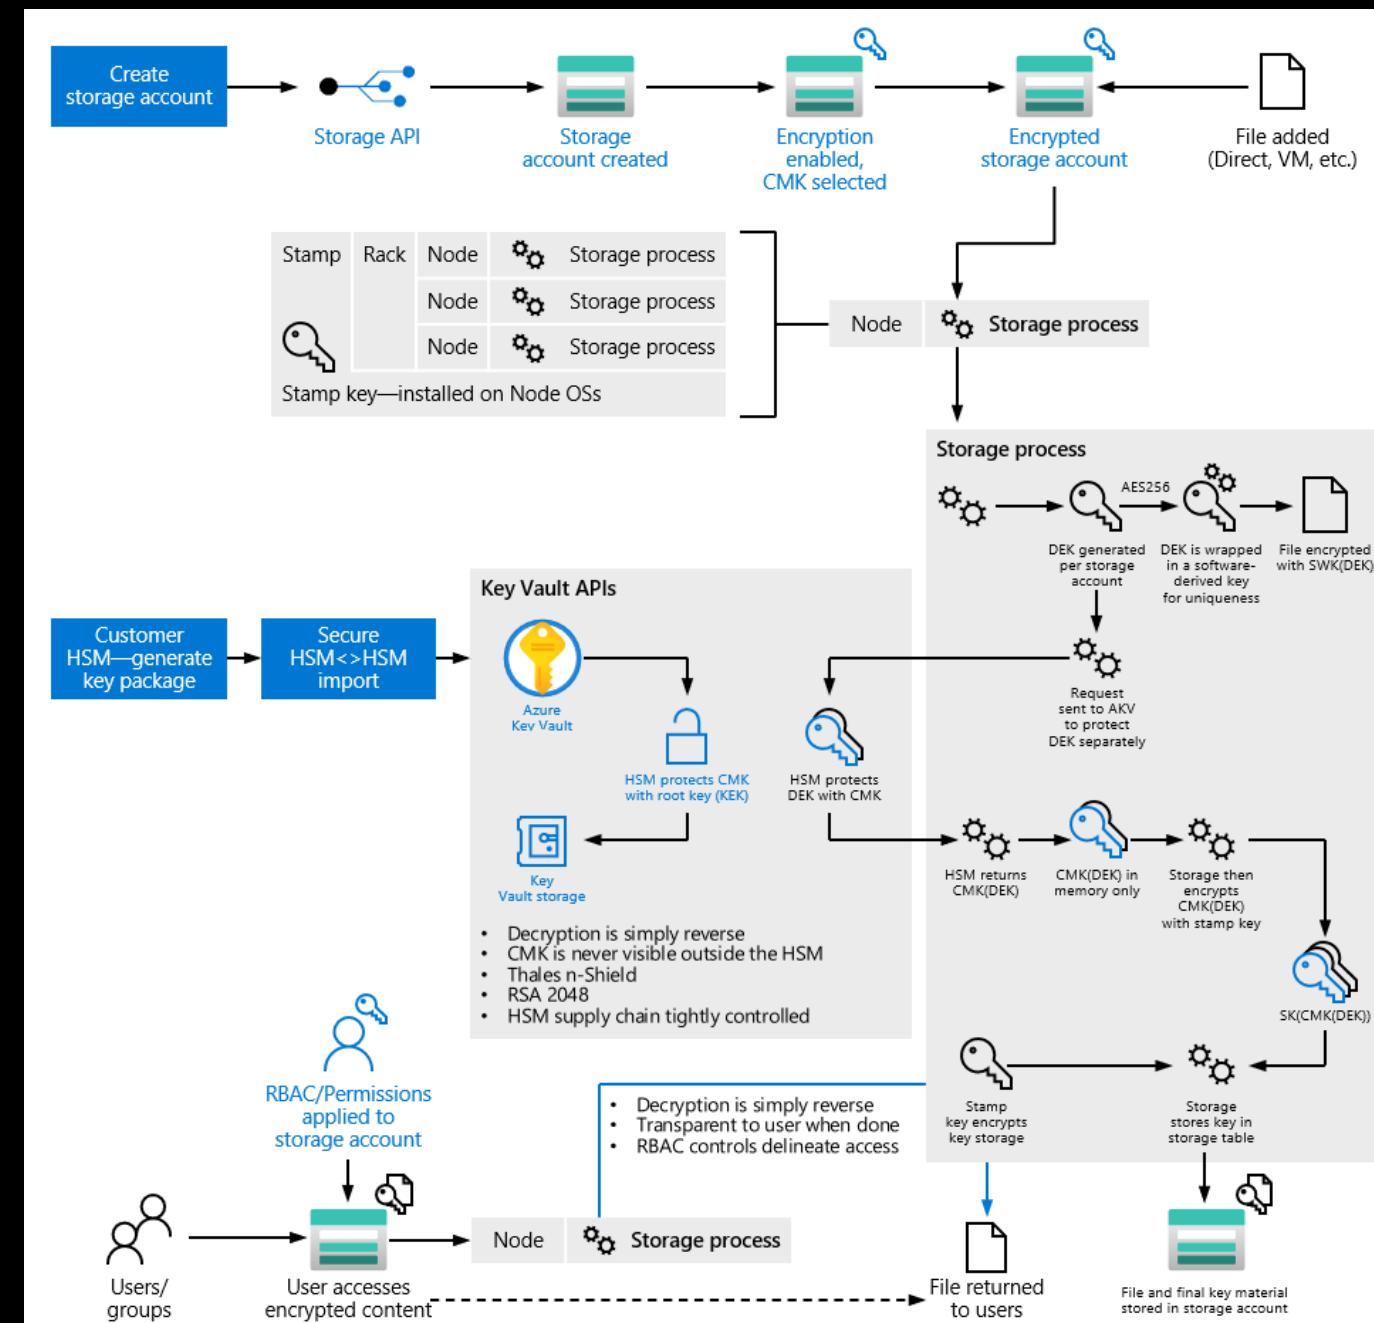

- Storage service encryption is enabled by default for all new and existing storage accounts and it cannot be disabled.

- The encryption process uses the following keys to help ensure cryptographic certainty of data isolation at rest:

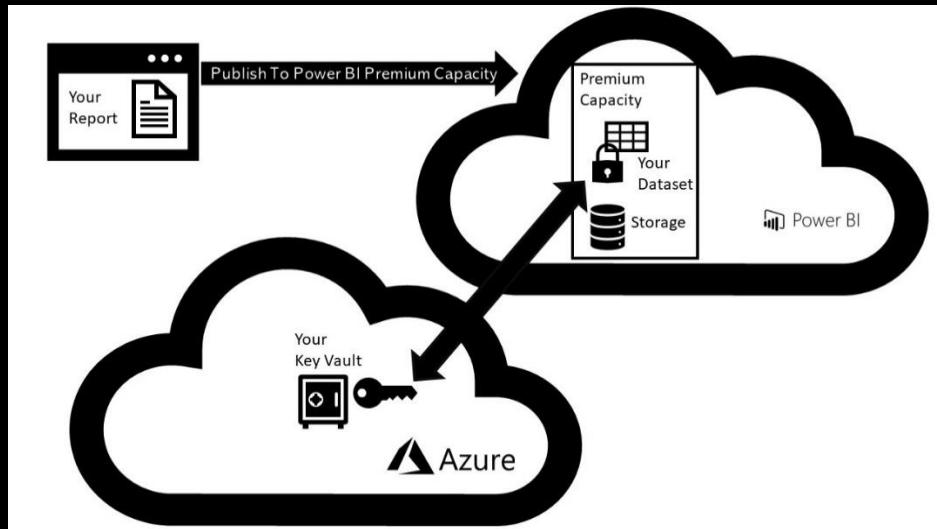

- Data Encryption Key (DEK)*

- Key Encryption Key (KEK)*

- Stamp Key (SK)*

# Is my data safe... - the one about secure data store | Power BI

[Bring your own encryption keys for Power BI - Power BI | Microsoft Docs](#)

## Encryption

Data at Rest

Data Source	Metadata	Data
Live Connection (Analysis Services)	Nothing stored except database name encrypted in Azure SQL DB	Nothing Stored
Direct Query (SQL Server, Oracle, etc.)	Encrypted in Azure Blob Storage	Nothing Stored
Pushed or streamed data	Encrypted in Azure Blob Storage	Depending on version, encrypted in either Azure Blob Storage or Azure SQL Database
Data loaded into model (data may be refreshable or nonrefreshable)	Encrypted in Azure Blob Storage	Encrypted in Azure Blob Storage

**Data in Transit**  
All data is encrypted using HTTPS to connect from the data source to the Power BI Service

**Data in Use**  
Data is cached for all connection types including DirectQuery  
Cached data is encrypted and stored in an Azure SQL Database

# Is my data safe...- the one about secure data store | Microsoft Information Protection & Azure Data Services

Discover

Classify

Label

Will be integrated into the Microsoft Information Protection framework  
Protects data and moves across database boundaries in your organization

Automatic Data Discovery and recommendations to classify sensitive data  
Each column associated with a sensitivity label and label type  
Manual classification on data can also be added

Column label persisted as column metadata as new classification attributes in SQL Engine  
Export classification information to Excel report for internal or external auditing purposes

Once a column is labeled it can be used for auditing and protection purposes  
All labeled columns will be fully audited at run time for any queries that access them  
Auditing will monitor which users access sensitive data and how much sensitive data they access

# End-to-End protection

Securing the full data journey from Azure to Office

The screenshot shows the Microsoft Azure Purview Data Catalog interface. The top navigation bar includes 'Microsoft Azure', 'Purview', and a search bar labeled 'Search assets'. The breadcrumb path indicates the asset is located under 'Browse assets > Azure Dedicated SQL Pool (formerly SQL DW) > 02\_company\_... > ip\_address'. The main content area displays the details for the 'ip\_address' asset, which is categorized as 'Highly Confidential/Internal Only' and is described as an 'Azure Dedicated SQL Pool Column'. The asset has two classifications: 'IP Address' and 'Personal IP Address'. The 'Properties' section lists various attributes such as userTypeid (167), columnEncryptionKeyDatabaseName, replicatedTo, replicatedFrom, qualifiedName (mssql://ress.database.windows.net/02\_company\_.../dbo/PII\_Customers#ip\_address), precision (0), length (20), encryptionType (0), columnEncryptionKeyId (0), description, scale (0), isXmlDocument (false), isMasked (false), encryptionTypeDesc, and xmlCollectionId (0). The right side of the screen shows sections for 'Last updated' (02/18/2021 09:27:54 UTC by [redacted]), 'Hierarchy', and 'Glossary terms' (No glossary terms for this asset).

**Step 3:**  
**Secure data interaction...- how to work with  
data in a secure way**

# Security Provisioning

# Secure data interaction... - how to work with data in a secure way |

## SQL DB / Azure Synapse

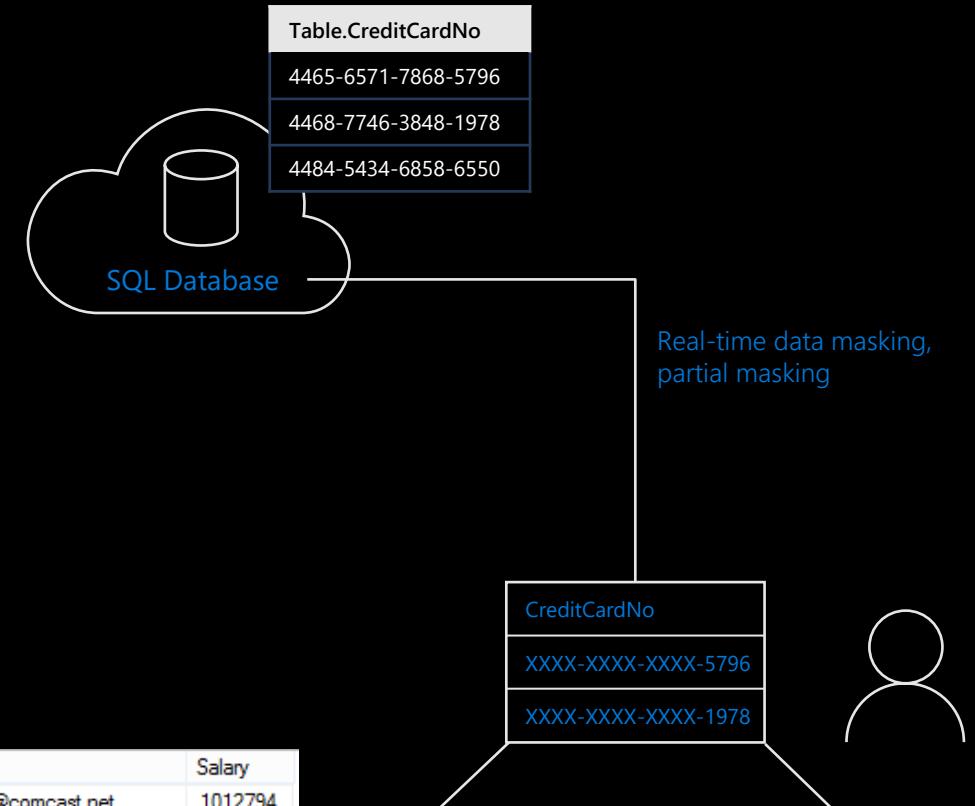

- Prevent abuse of sensitive data by hiding it from users
- Data masking applied in real-time to query results based on policy
- Multiple masking functions available, such as full or partial, for various sensitive data categories (credit card numbers, SSN, etc.)

The screenshot shows the Power BI Model view. On the left, there's a tree view of the data model with nodes like Data Sources, Perspectives, Relationships, Roles, Shared Expressions, Tables, and Translations. Under Roles, 'Marketing' is selected. In the center, there's an Expression Editor window with tabs for DAX and Advanced Scripting. On the right, there's a detailed view of the 'Basic' and 'Security' properties for the 'Finance' role. The 'Security' section shows that Row Level Security (RLS) is disabled (0 out of 22 tables) and Object Level Security (OLS) is enabled on 3 out of 22 tables. A red box highlights the 'OLS enabled on 3 out of 22 tables' text.

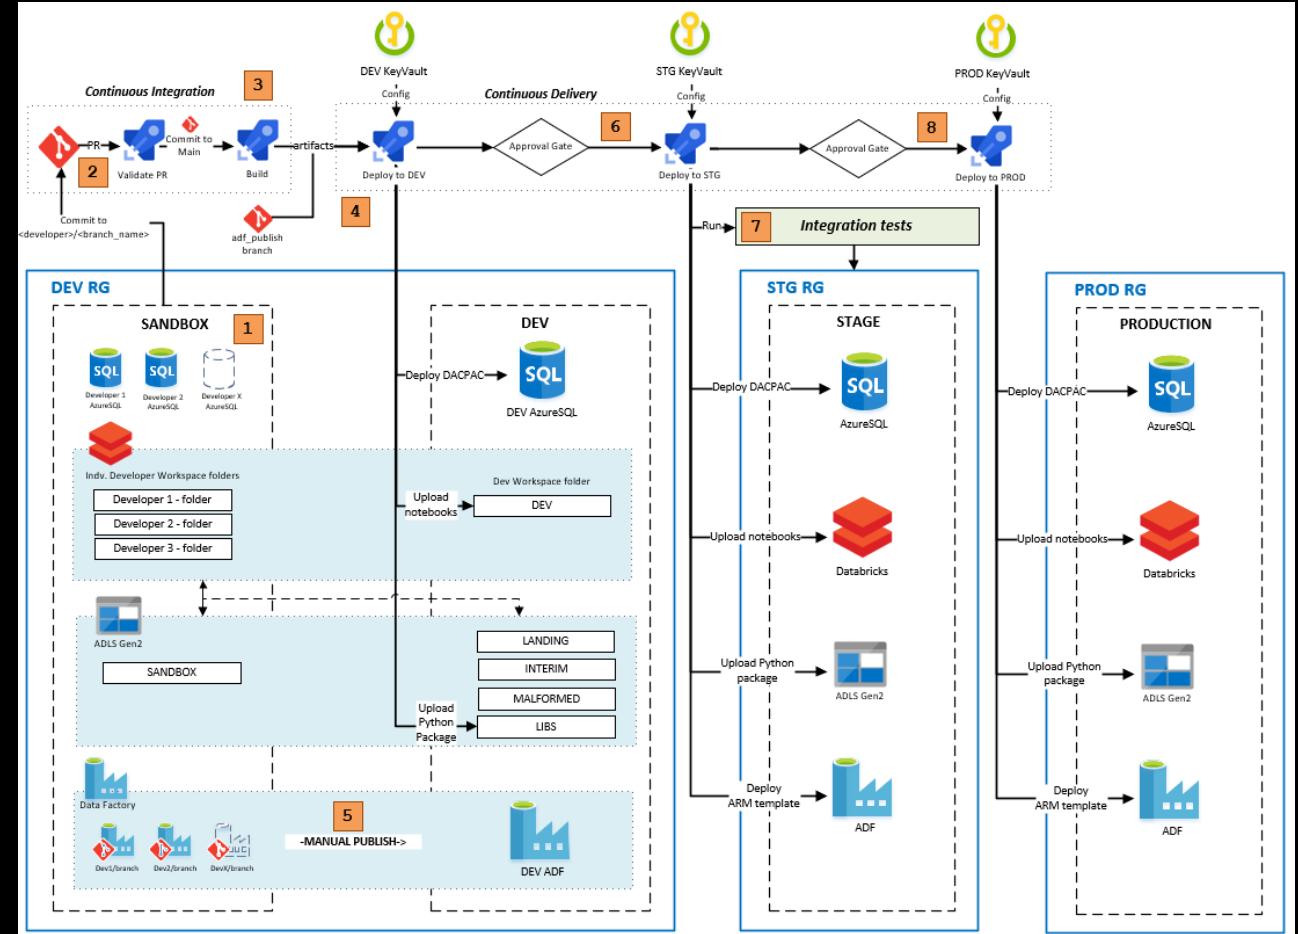

# Data loss prevention

Microsoft Cloud App Security (MCAS) Integration

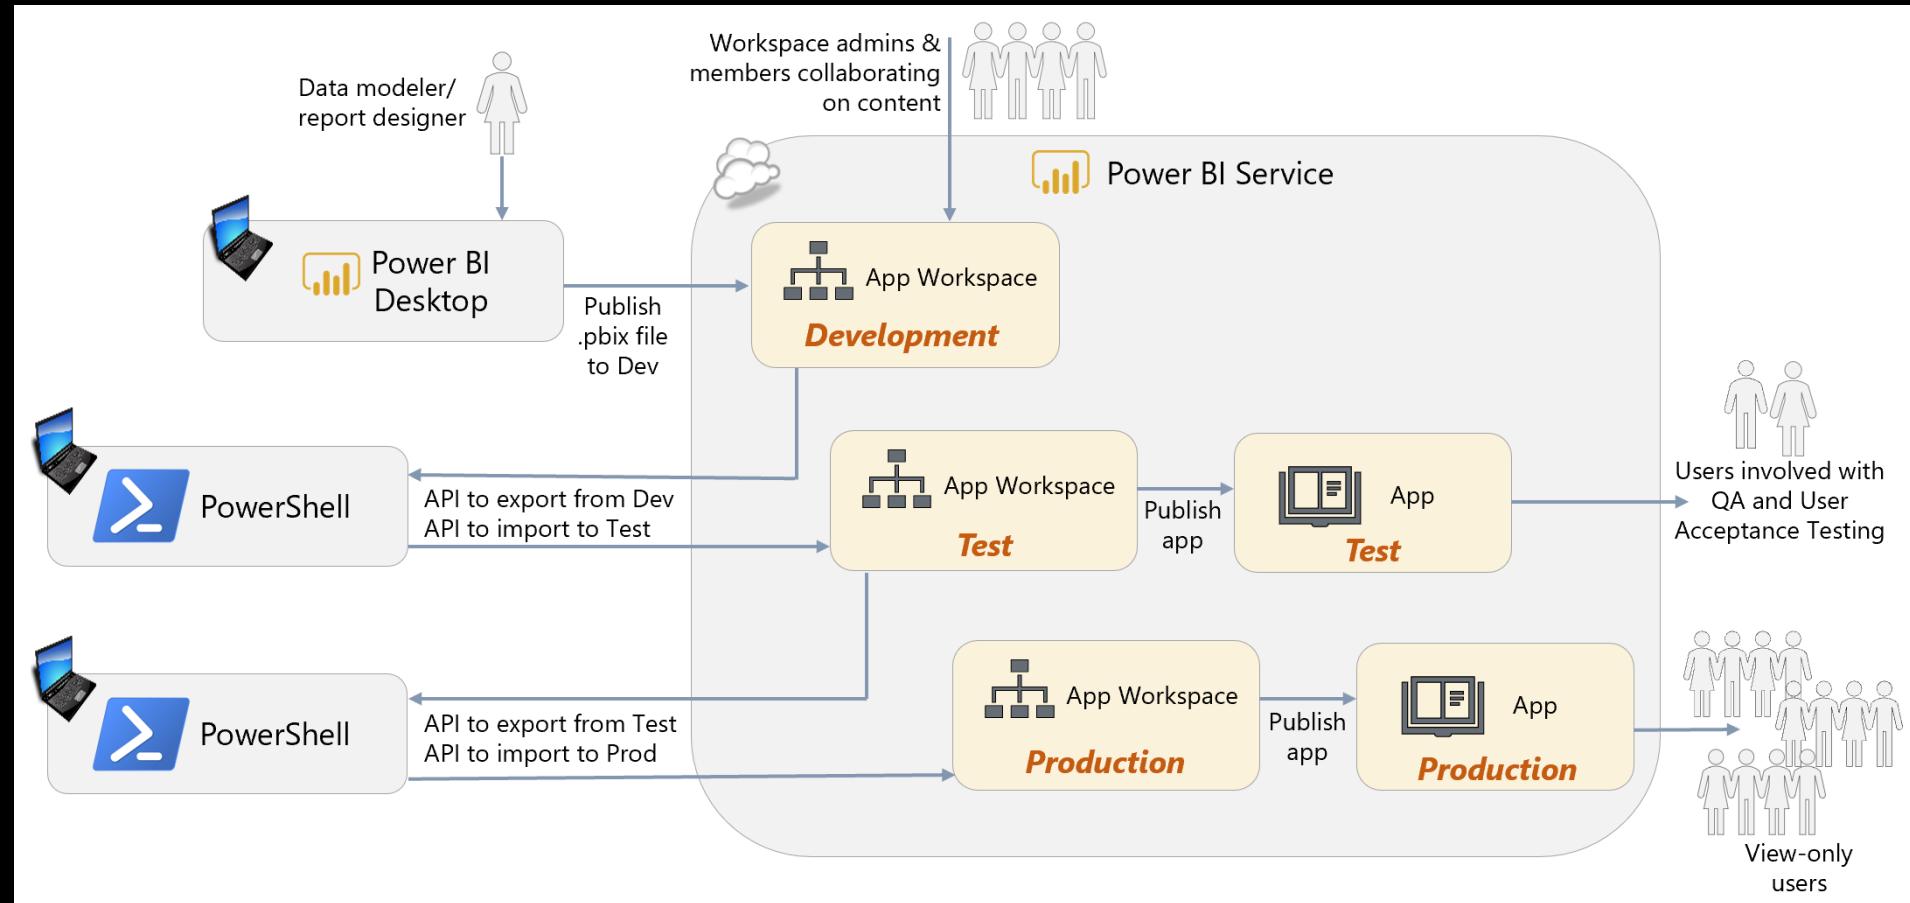

# Secure data interaction... - how to work with data in a secure way | Dev / Test / Prod Environments

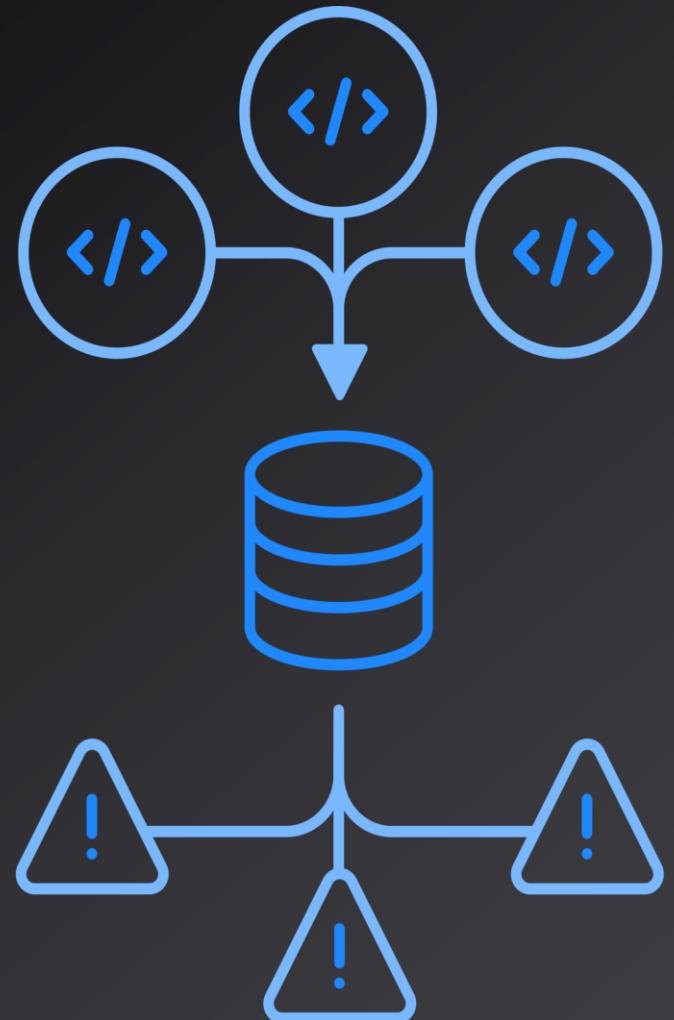

[DataOps for the modern data warehouse - Azure Architecture Center | Microsoft Docs](#)

# Secure data interaction... - how to work with data in a secure way | Dev / Test / Prod Environments

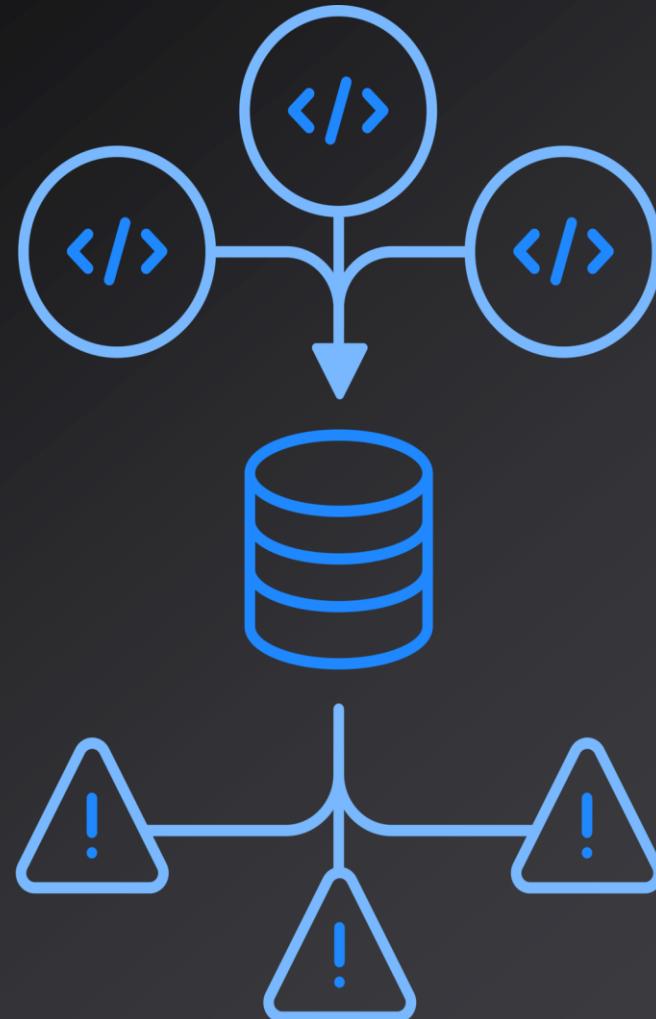

# Main goals to address

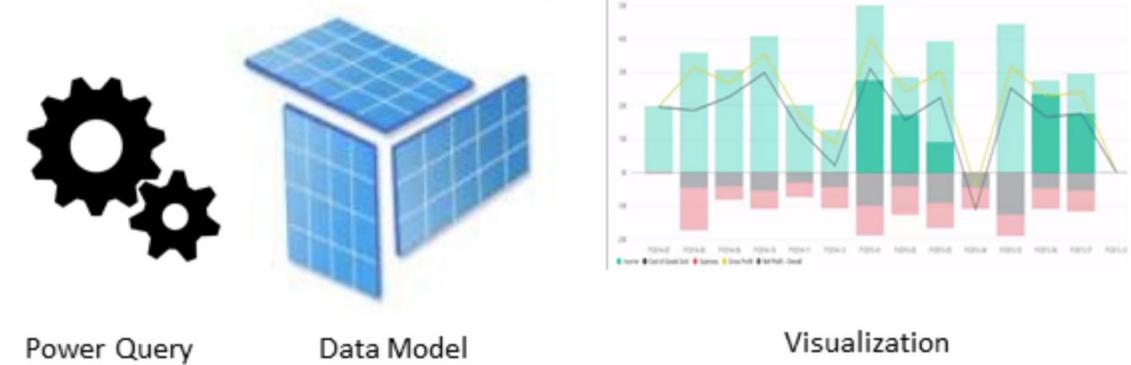

- **Version Control** - The ability to manage your solution in versions. Tracking changes and maintain the history for review and recovery.
- **Branching** - The ability to support multi developer scenarios with each developer working on his own copy of the solution to enhance it with features
- **CI/CD** - Continuous Integration and Continuous Delivery targets an incremental metadata merge of new
- **Environments** - Support for work in several separated development stages (e.g. DEV, TEST and PROD) enabling secure development and testing in environments with different characteristics.
- **Automation** - The ability to provide secure, reliable, fast and repeatable development and deployment processes

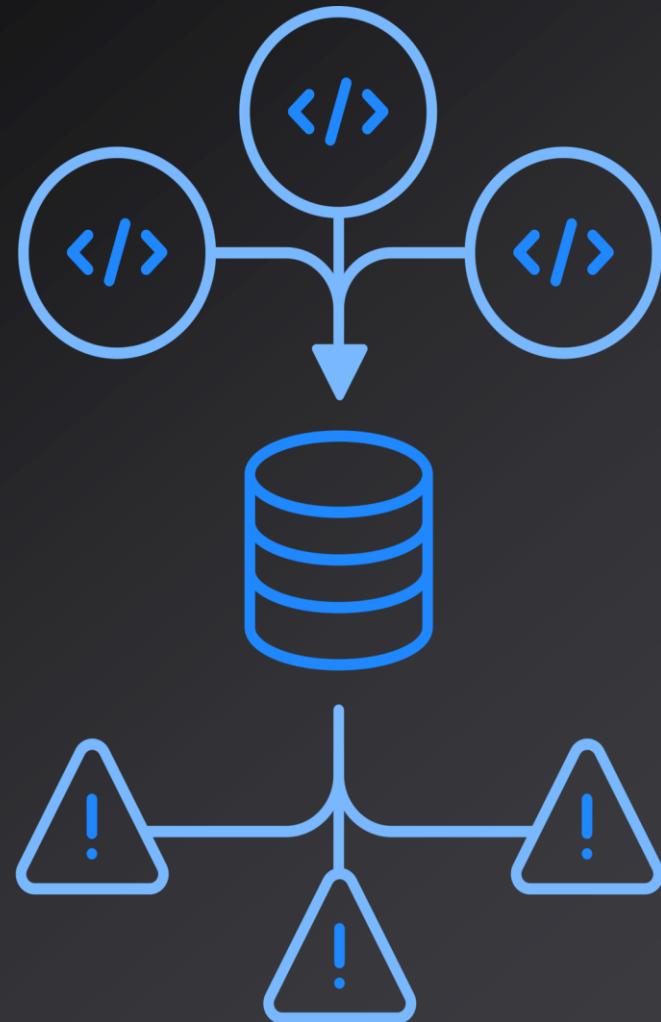

# Why it is a challenge

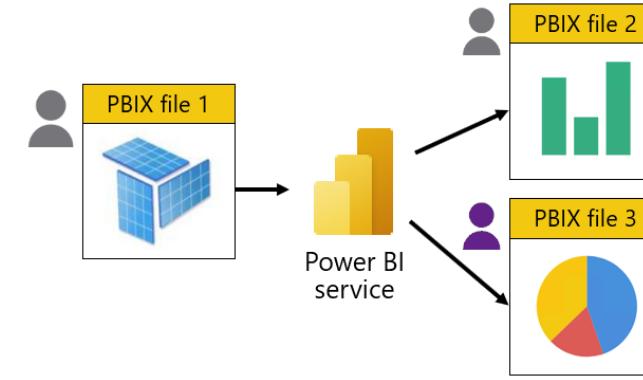

- **ETL/Pipeline** - PowerQuery imports to fetch data from sources
- **Datamodel** - Model containing imported tables,
- **Visual Layer** - Report canvas

# How to...

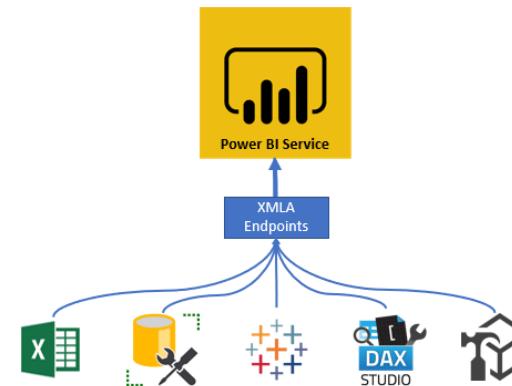

- Separation of reports and data model

[Separate reports from models in Power BI Desktop - Power BI | Microsoft Docs](#)

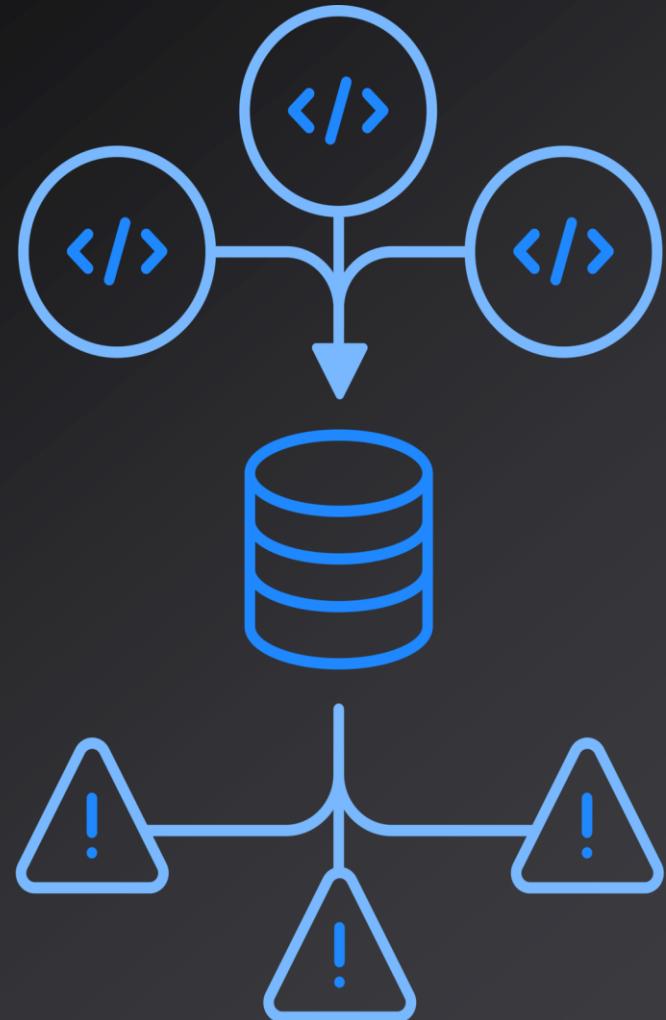

- **Power BI Premium or Premium per User** to utilize XMLA read/write Endpoints as well as Deployment Pipelines

[Power BI XMLA Endpoint: Why you should care - Guy in a Cube](#)

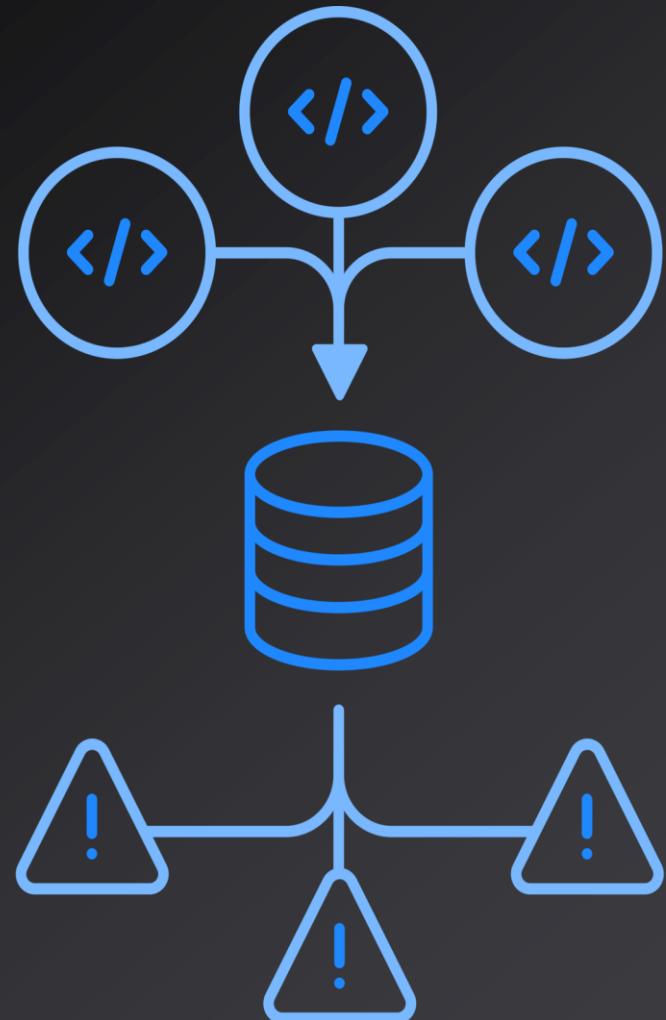

# How to...version history

- OneDrive / SharePoint sync
  - Good for small projects & teams
- Git repositories
  - pbix files are binary files, there is no way of checking-in only the code changes
  - Git extension called Large File Storage (LFS)

# How to...automate

## PowerShell cmdlets, REST APIs, and .NET Client library for Power BI administration

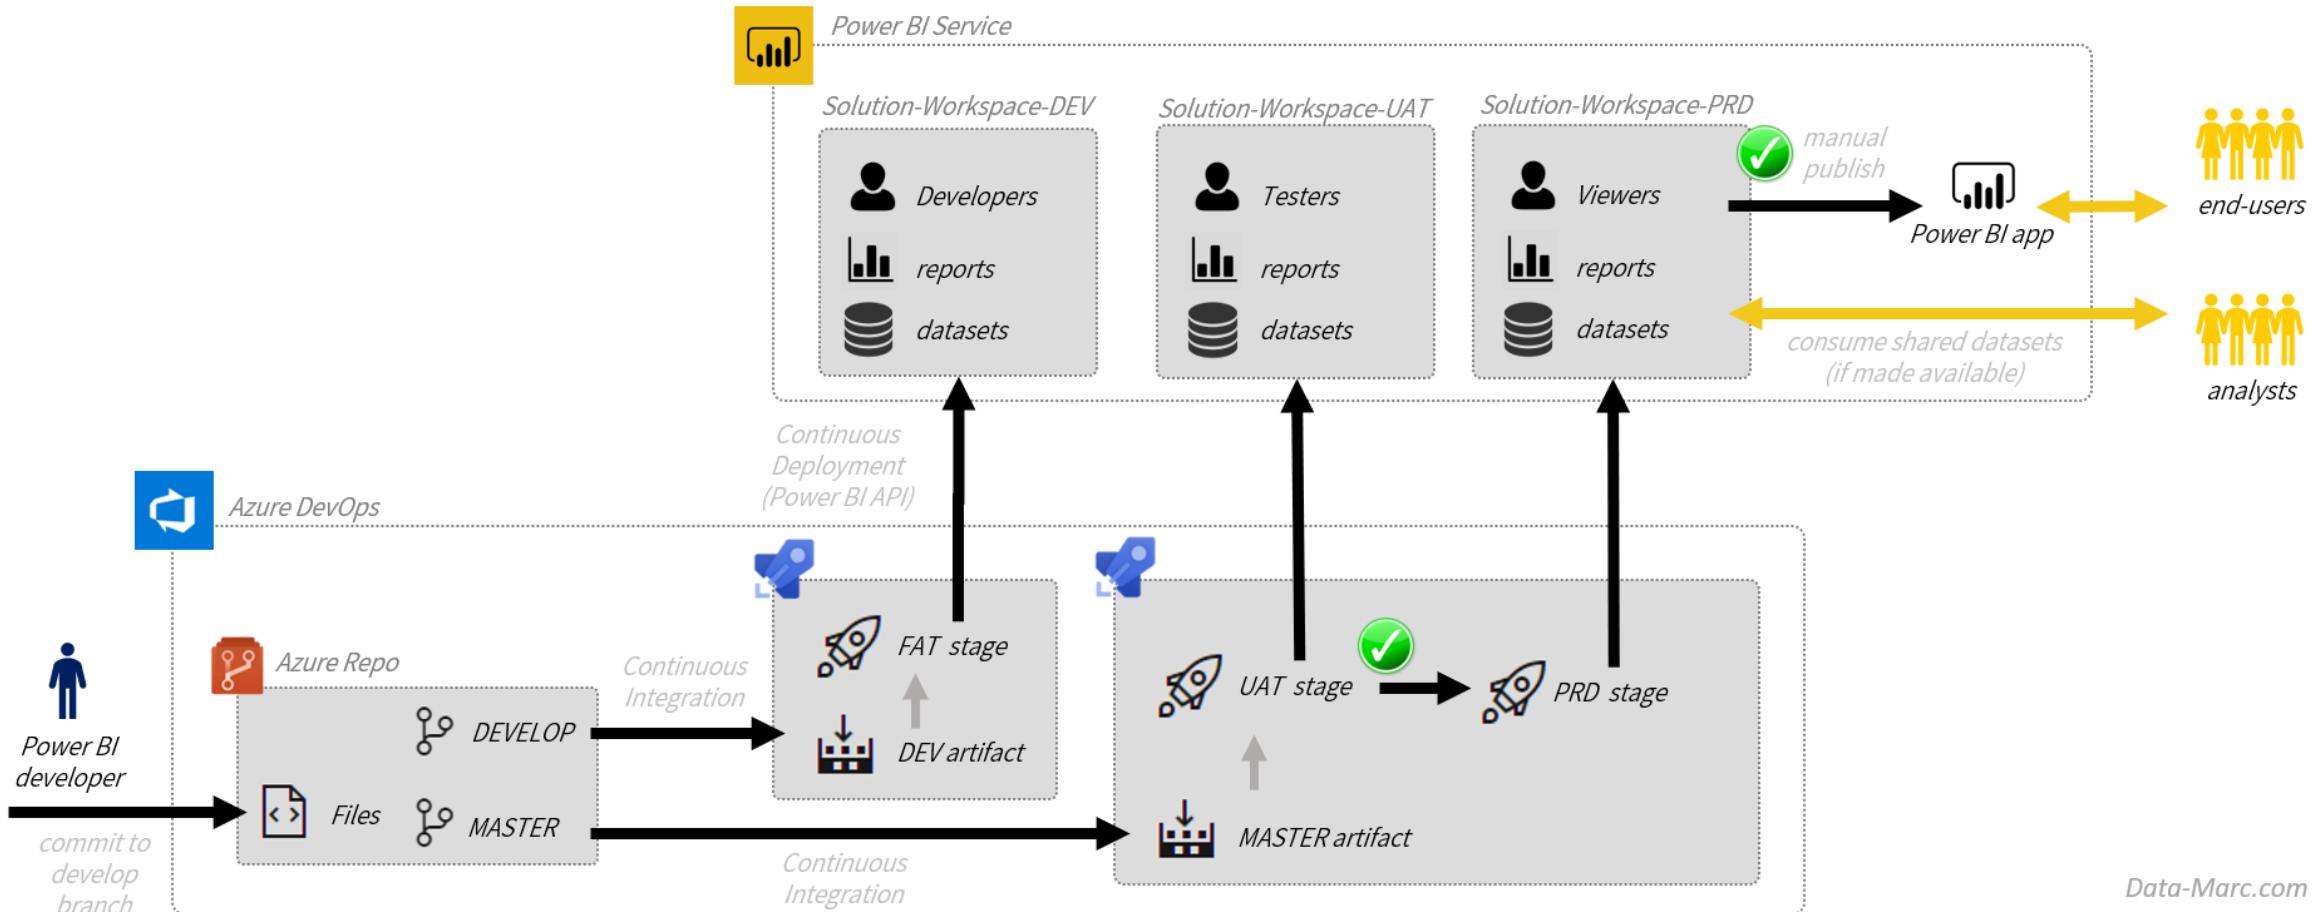

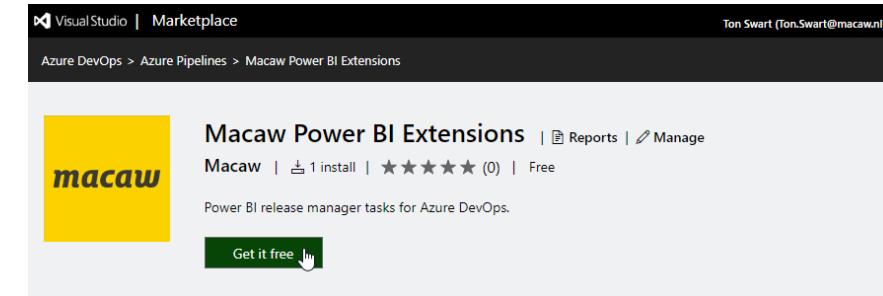

Power BI enables administrators to script common tasks with PowerShell cmdlets.

- PowerShell [download](#) and [documentation](#)

It also exposes REST APIs and provides a .NET client library for developing administrative solutions.

- REST API [documentation](#)
- .NET Client library [download](#)

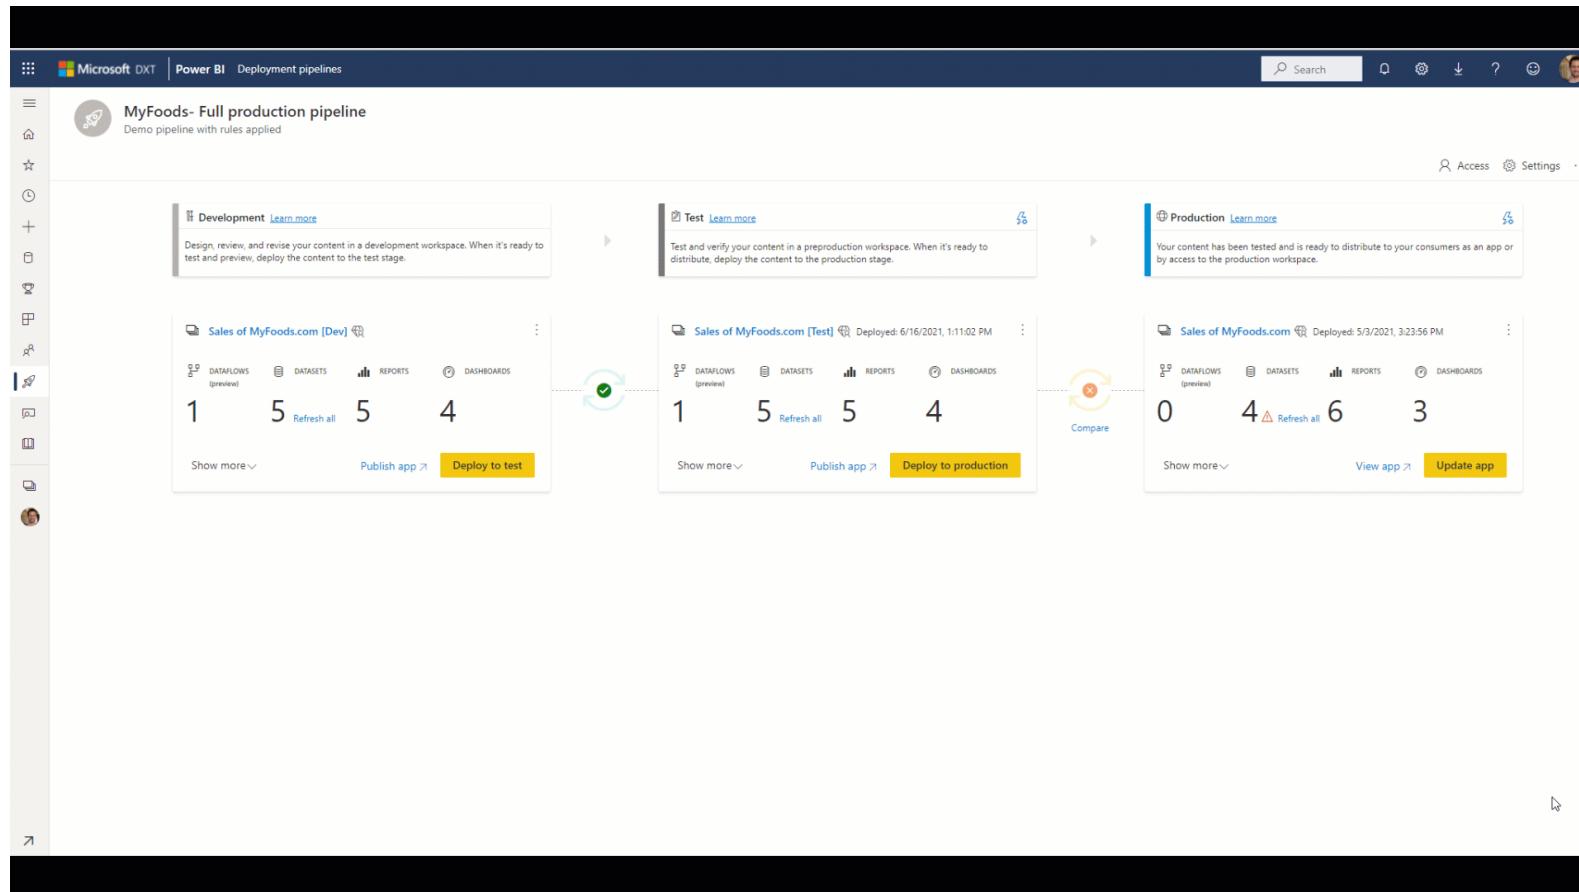

# Continuous Delivery with Azure DevOps

[Announcing new deployment pipelines capabilities | Microsoft Power BI Blog | Microsoft Power BI](#)

# Automate your deployment pipeline, the Power BI Application lifecycle management (ALM) tool - Power BI | Microsoft Docs

## Deployment pipelines Power BI REST APIs:

- Integrate Power BI into familiar DevOps tools such as Azure DevOps or GitHub Actions.
- Schedule pipeline deployments to happen automatically at a given time.
- Deploy multiple pipelines at same time.
- Cascade depending pipeline deployments – If you have content that's connected across pipelines, you can make sure some pipelines are deployed before others.

[PowerBI-Developer-Samples/PowerShell Scripts at master · microsoft/PowerBI-Developer-Samples \(github.com\)](https://github.com/microsoft/PowerBI-Developer-Samples)

[Automate deployments with deployment pipelines API | Microsoft Power BI Blog | Microsoft Power BI](https://powerbi.microsoft.com/en-us/blog/automate-deployments-with-power-bi-deployment-pipelines-api/)

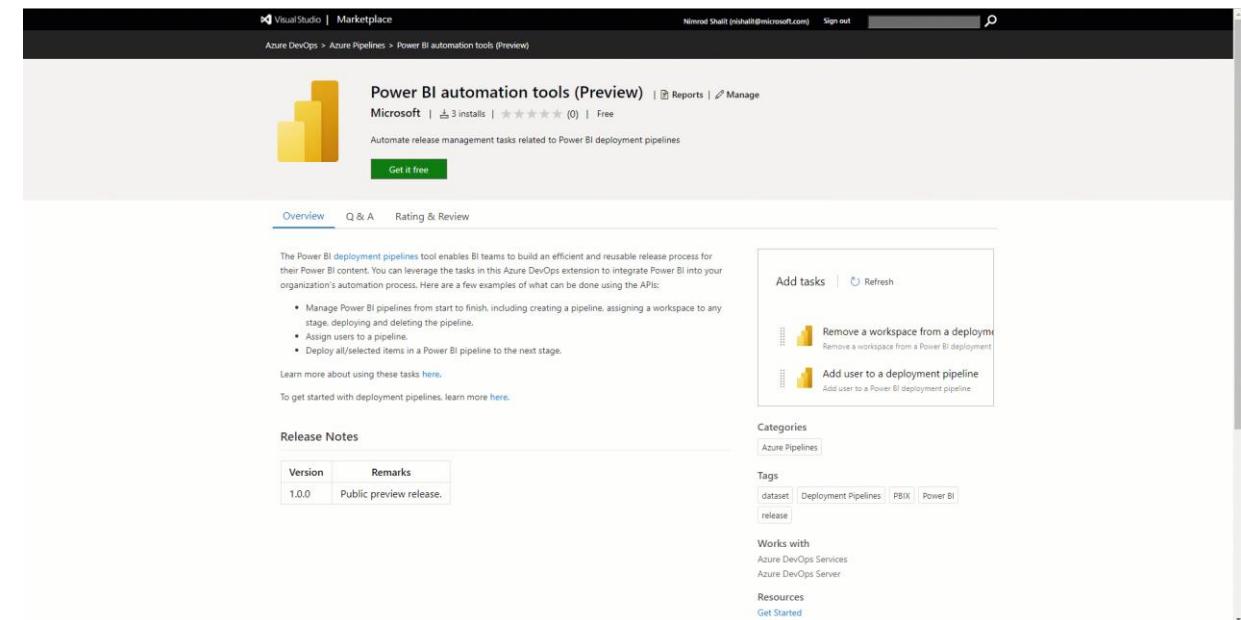

# Deployment pipelines- Azure DevOps extension, multiple pipelines working together,

## Dataflows GA | Microsoft Power BI Blog | Microsoft Power BI

[Deployment pipelines- Azure DevOps extension | Microsoft Power BI](#)

The extension contains all the API operations available today for deployment pipelines. Using the extension, you can set tasks for:

- Creating and editing pipelines
- Assigning workspaces
- Adding users to a pipeline and a workspace
- Managing deployments across the pipeline stages

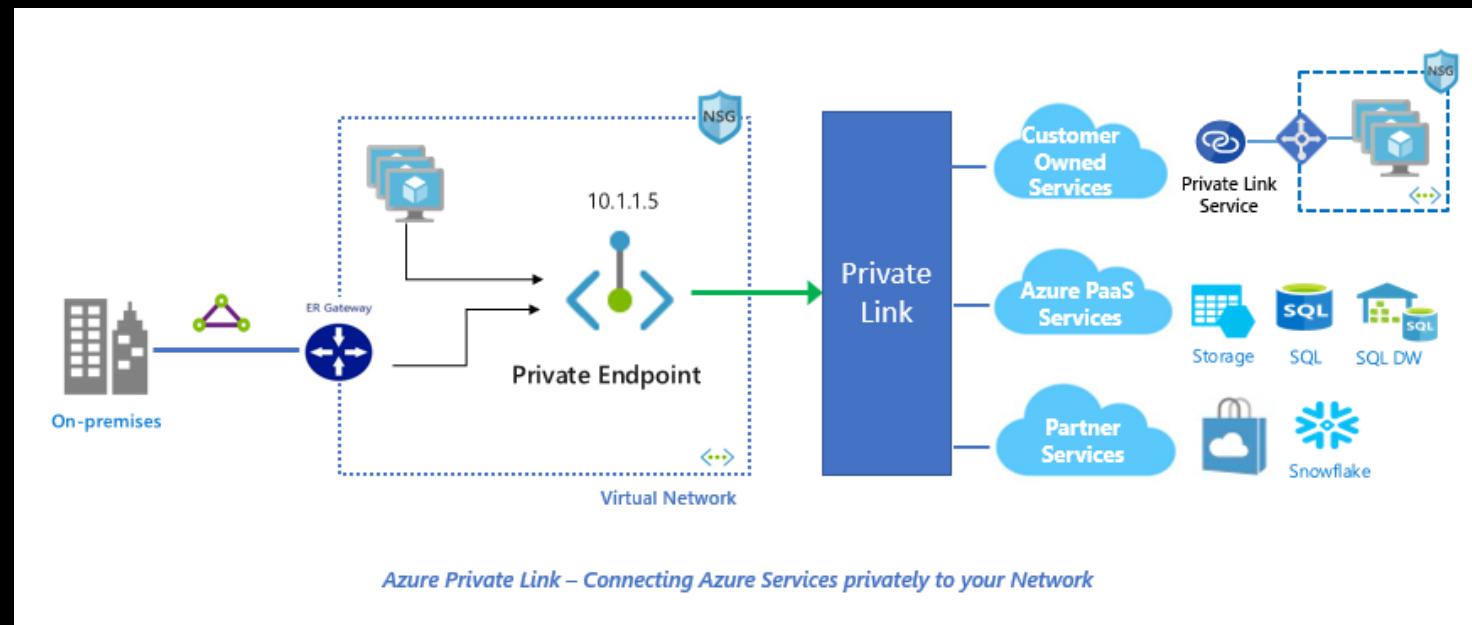

**Step 4:**  
**Make it private...- Isolated environment**

# Make it private...- Isolated environment

Private endpoint enables connectivity between the consumers from the same:

- Virtual Network
- Regionally peered virtual networks
- Globally peered virtual networks
- On premises using VPN or Express Route
- Services powered by Private Link

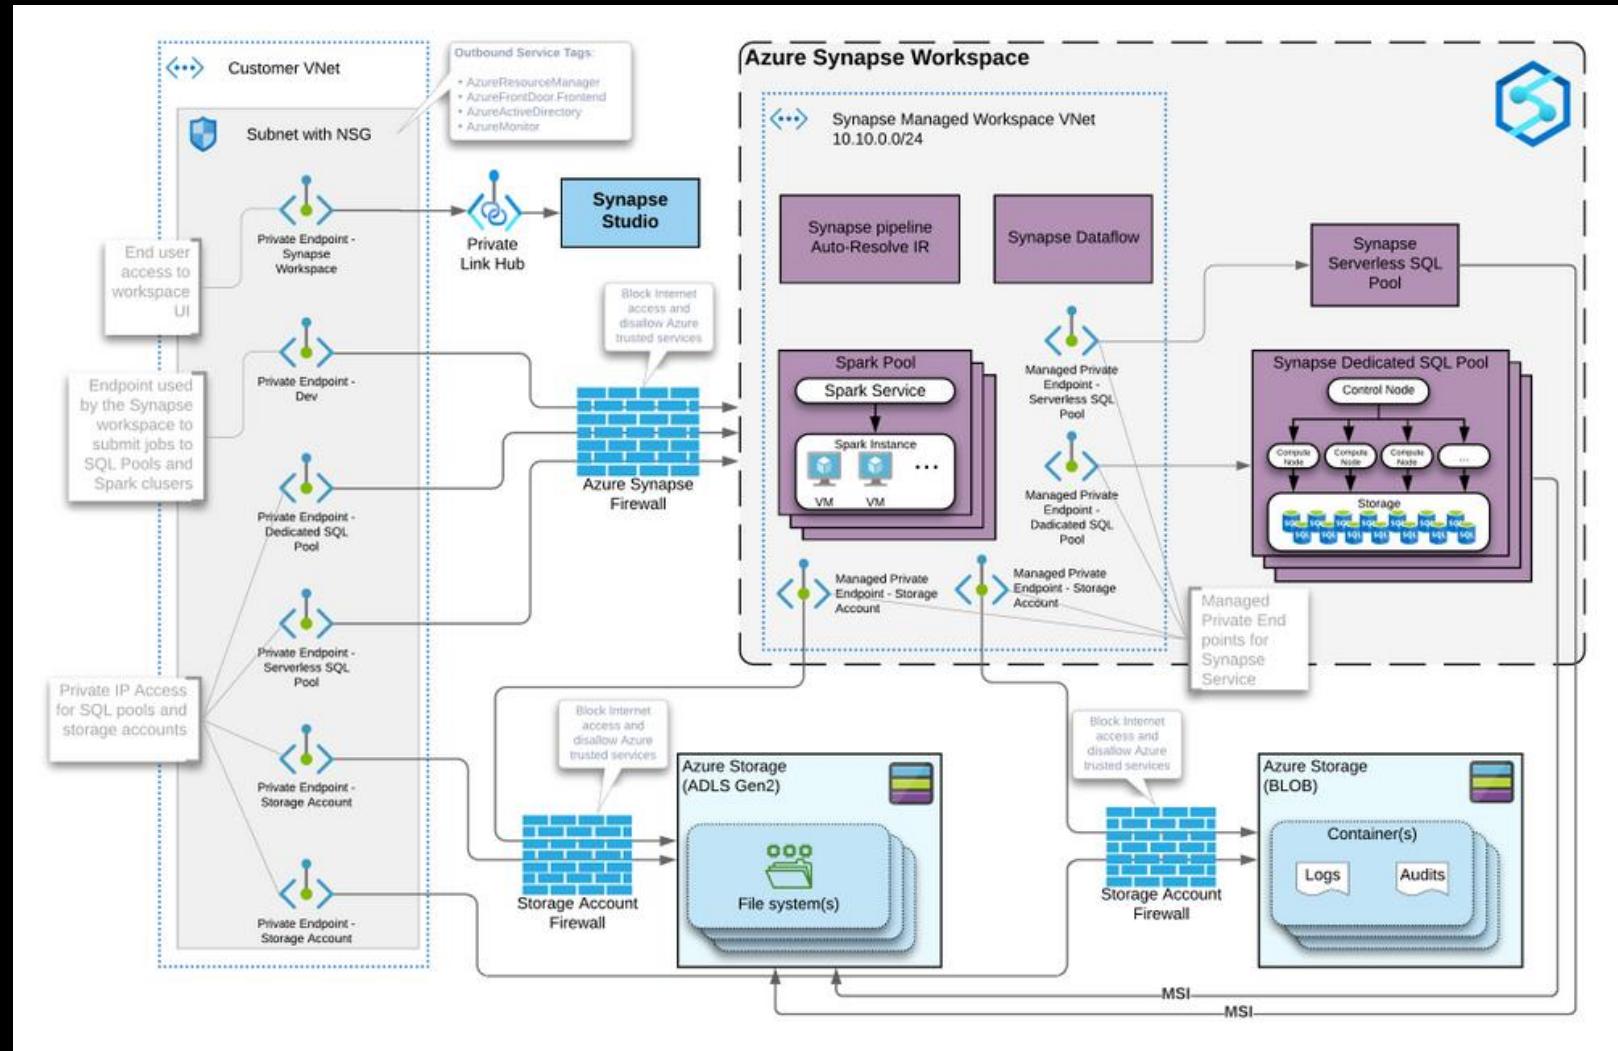

# Make it private...- Isolated environment

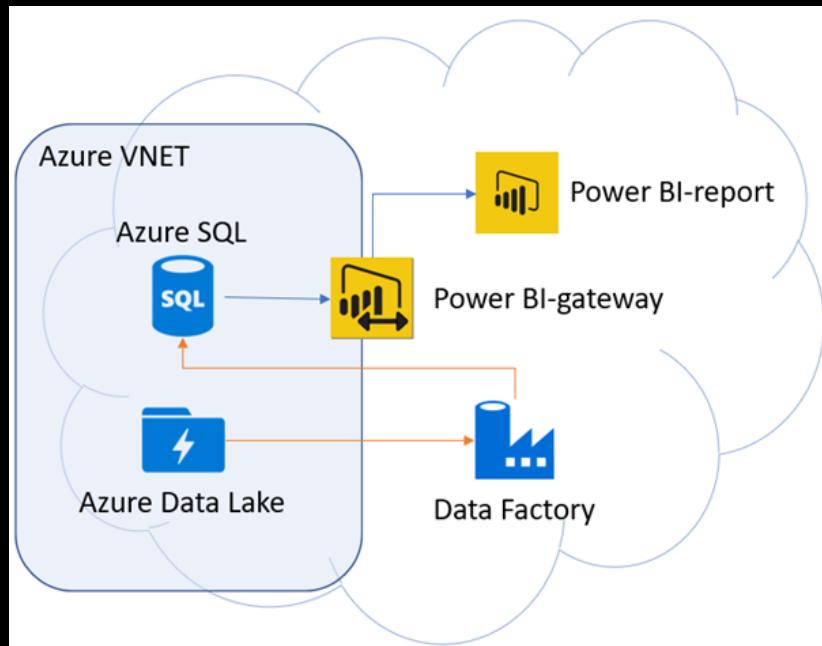

[Understanding Azure Synapse Private Endpoints - Microsoft Tech Community](#)

<https://aka.ms/azsynapsee2e-git>

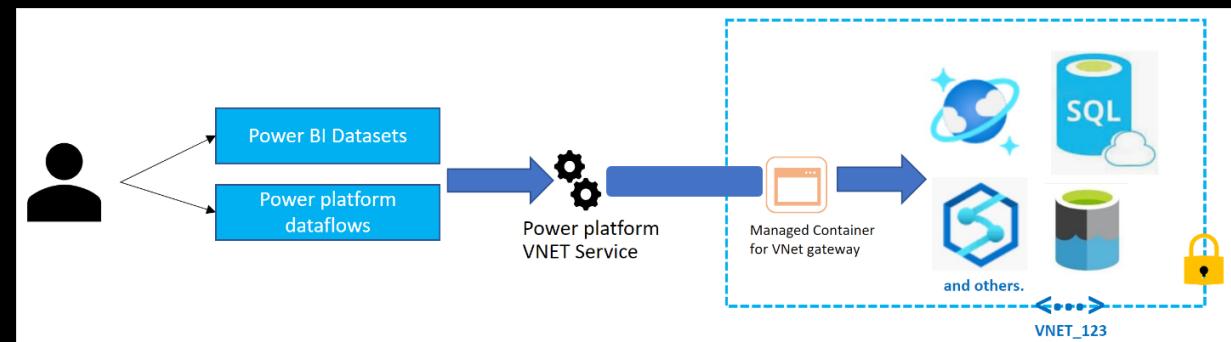

AAC Article:  
<https://aka.ms/azsynapsee2e-doc>

# Make it private...- Isolated environment

Power BI Gateway

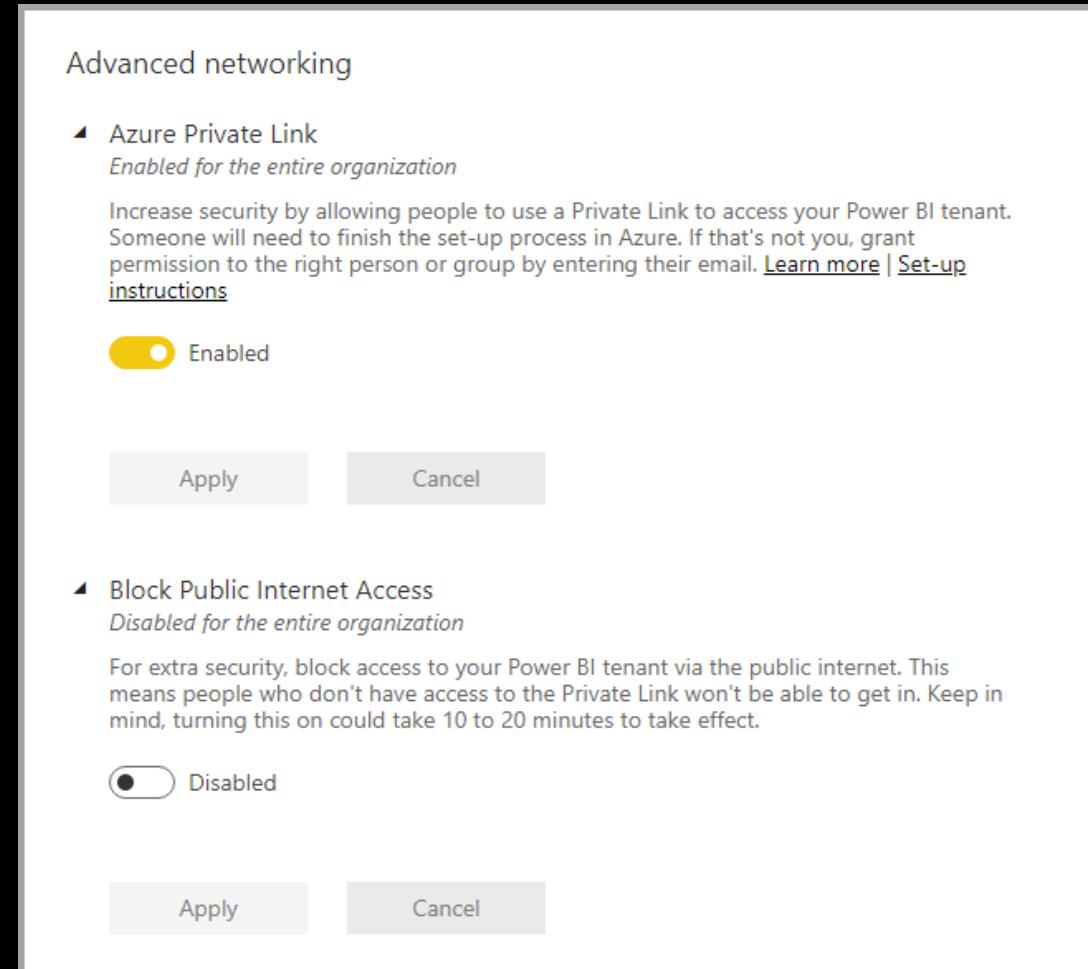

Power Platform VNET Service

[What is a virtual network \(VNet\) data gateway \(Preview\) | Microsoft Docs](#)

[Virtual network \(VNet\) data gateway architecture](#)

# Make it private...- Power BI isolated environment

- Private endpoints guarantee that traffic going *into* your organization's Power BI artifacts (such as reports, or workspaces) always follow your organization's configured private link network path. User traffic to your Power BI artifacts must come from the established private link.
- You can configure Power BI to deny all requests that don't come from the configured network path.
- Private endpoints *do not* guarantee that traffic from Power BI to your external data sources, whether in the cloud or on premises, is secured. Configure firewall rules and virtual networks to further secure your data sources.

# Make it private...- Power BI isolated environment

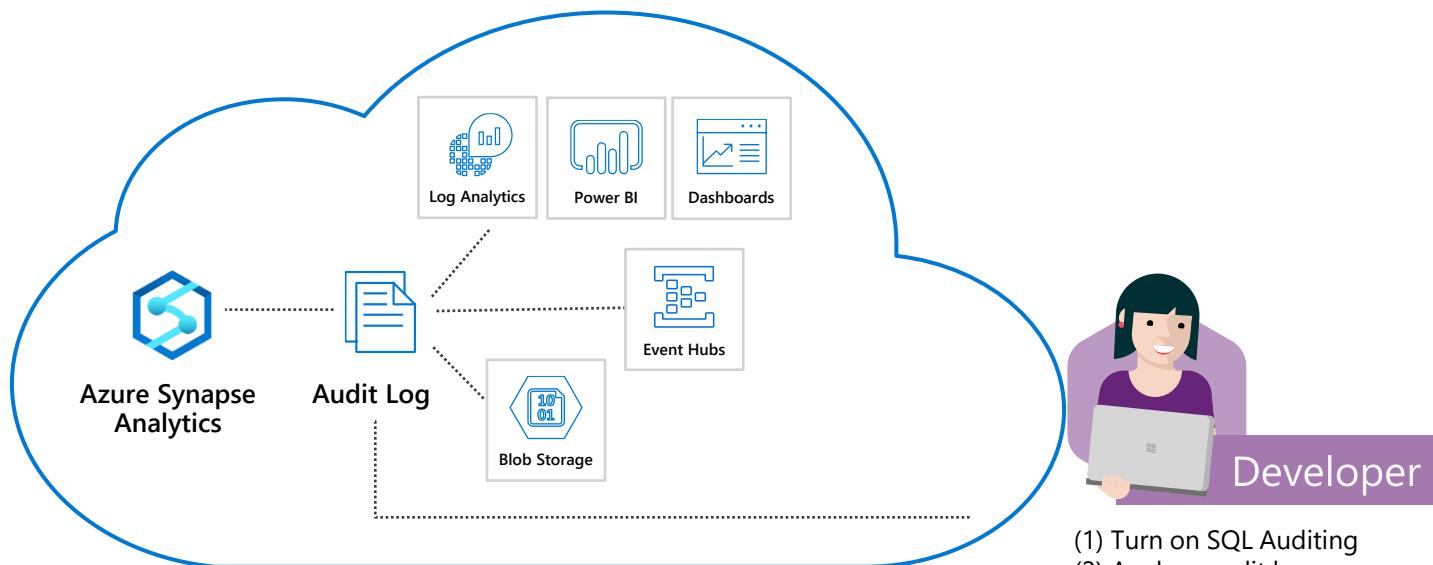

**WHY you shouldn't use private endpoints for accessing Power BI**

[Private endpoints for accessing Power BI - Power BI | Microsoft Docs](#)

**Step 5:**  
I know what you did... - monitoring & auditing

# I know what you did... - monitoring & auditing

## Gain insight into database audit log

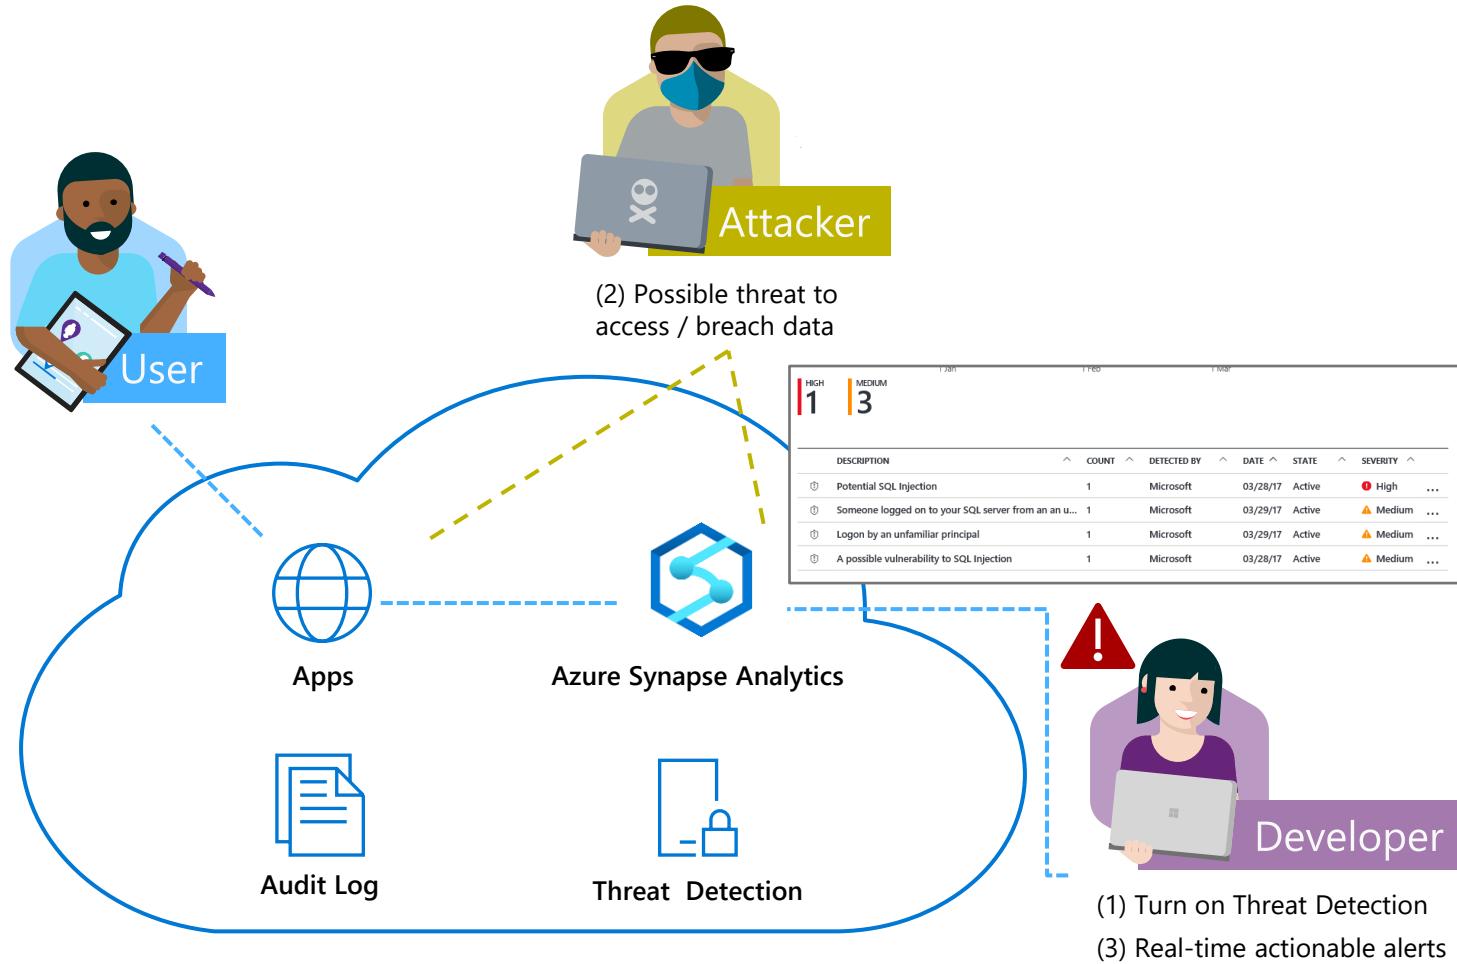

A screenshot of the Azure Log Analytics interface. The top navigation bar includes Refresh, Saved Searches, Analytics, New Alert Rule, Export, and PowerBI. The main area shows a search bar with the query: `search * | where Category == "SQLSecurityAuditEvents" | project TimeGenerated, server_principal_name_s, statement_s, affected_rows_d, SeverityLevel | sort by TimeGenerated asc`. Below the search bar, it says "62 Results" and provides options to switch between List and Table view. A table is displayed with columns: TimeGenerated, server\_principal\_name\_s, statement\_s, affected\_rows\_d, and SeverityLevel. The table contains several rows of audit log data, with the second row highlighted in blue.

TimeGenerated	server_principal_name_s	statement_s	affected_rows_d	SeverityLevel
8/15/2018 12:00:22.521 AM	admin1	exec sp_executesql N'SELECT tbl.name AS [Name], SCHEMA_NAME(tbl...	0	0
8/15/2018 12:00:22.521 AM	admin1	exec sp_executesql N'SELECT ISNULL(HAS_PERMS_BY_NAME(QUOTEN...	1	0
8/15/2018 12:00:22.521 AM	admin1	DECLARE @edition sysname; SET @edition = cast(SERVERPROPERTY(N...	4	0
8/15/2018 12:00:22.521 AM	admin1	exec sp_executesql N'SELECT CAST(f1.is_enabled AS bit) AS [IsEnabled]...	0	0
8/15/2018 12:00:22.521 AM	admin1	IF OBJECT_ID ('[sys].[database_query_store_options]') IS NOT NULL BE...	2	0

- ✓ Configurable via audit policy
- ✓ SQL audit logs can reside in
  - Azure Storage account
  - Azure Log Analytics
  - Azure Event Hubs
- ✓ Rich set of tools for
  - Investigating security alerts
  - Tracking access to sensitive data

# I know what you did... - monitoring & auditing

## Detect and investigate anomalous database activity

- ✓ Detects potential SQL injection attacks
- ✓ Detects unusual access & data exfiltration activities
- ✓ Actionable alerts to investigate & remediate
- ✓ View alerts for your entire Azure tenant using Azure Security Center

# I know what you did... - monitoring & auditing

## Set up

The screenshot shows the Azure portal interface for managing a SQL server named 'shellfish'. The left sidebar has a 'Security' section with 'Advanced Threat Protection' selected. The main area displays the 'Advanced Threat Protection' settings. It includes a trial invitation message, a status switch for 'Advanced Threat Protection' (set to 'ON'), and 'THREAT DETECTION SETTINGS' for sending alerts to specific users or groups. There are also sections for 'Storage details' and 'Threat Detection types'. A note at the bottom encourages enabling auditing.

## Alert

The screenshot shows an email from Microsoft Azure titled 'Azure Database: Potential exploitation of application vulnerability to SQL i...'. The subject line indicates a 'HIGH SEVERITY' alert. The email body states: 'We detected a potential exploitation of application code vulnerability to SQL injection. This may indicate a SQL injection attack on database 'kjDWfordemos''. Below this, there's a 'View recent alerts >' button and a detailed 'Activity details' section. The 'Activity details' table lists various parameters such as Severity (High), Subscription ID, Subscription name, Server, Database, IP address, Principal name, Application, Date, Threat ID, Potential causes (Defect in application code constructing faulty SQL statements; application code doesn't sanitize user input and was exploited to inject malicious SQL statements.), Investigation steps (View the vulnerable SQL statement), and Remediation steps (Read more about SQL injection threats, as well as best practices for writing safe application code). The table also includes columns for EventID, Database, ApplicationName, and ActionStatus.

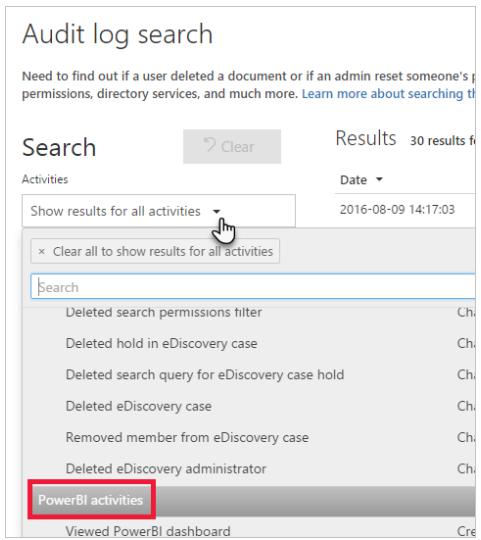

## Explore

The screenshot shows the 'Audit record' interface in the Azure portal. It displays a table of audit logs with columns for 'TIMESTAMP', 'EVENT ID', 'SERVER NAME', 'DATABASE NAME', 'PRINCIPAL NAME', 'CLIENT IP', 'APPLICATION NAME', 'ACTION STATUS', 'FAILURE REASON', 'RESPONSE ROWS', 'AFFECTED ROWS', 'SERVER DURATION', and 'STATEMENT'. Below the table is a preview of the audit log data, showing rows of audit entries with columns for Database, Application, and Action.

# Introducing Enterprise Scale Analytics and AI

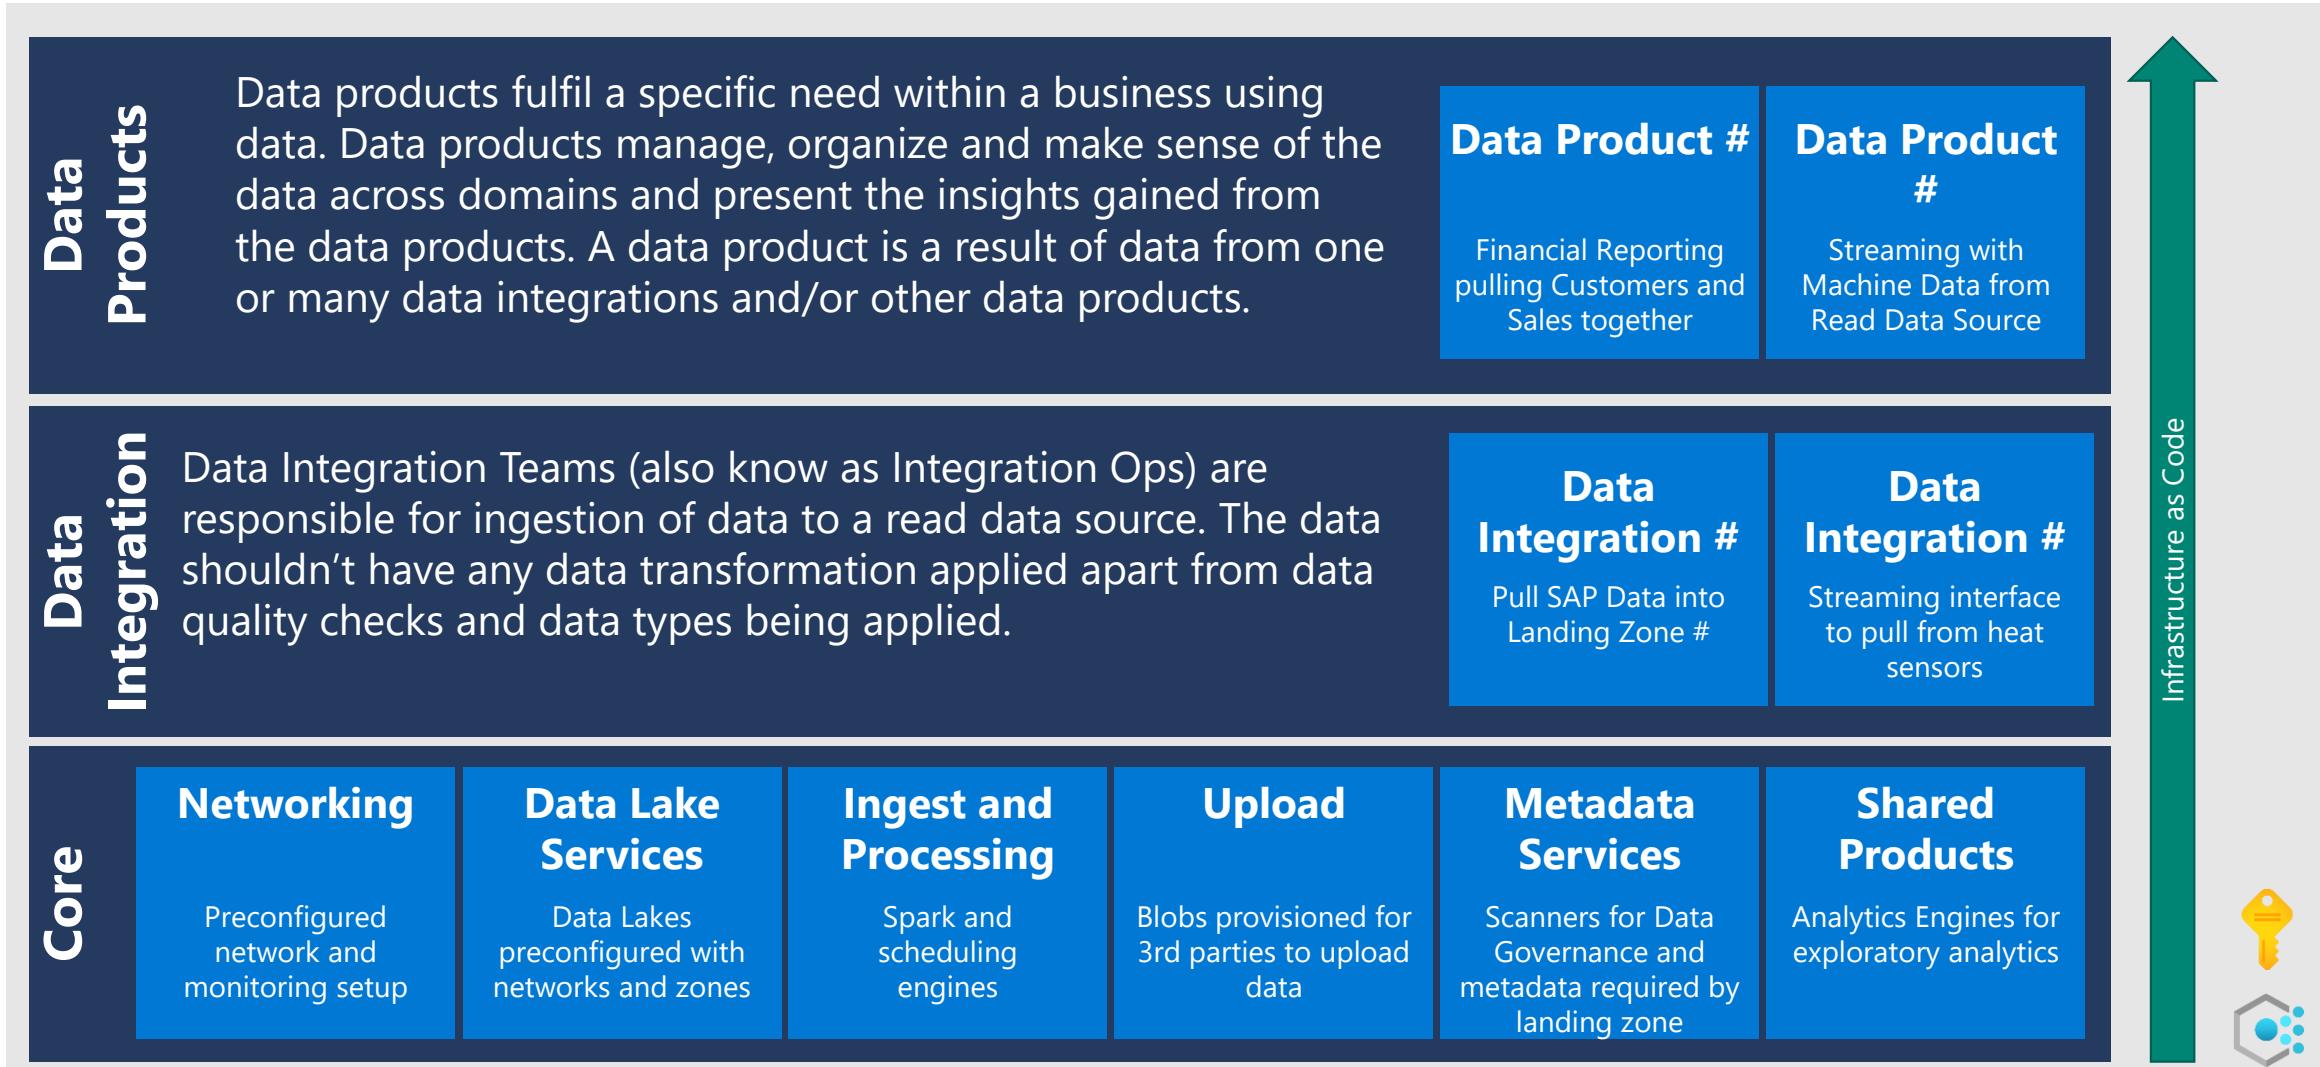

# Principles

- Classify governance activities into a single Landing Zone called Data Management Landing Zone.
  - Governance is decentralized and democratized but controlled by centrally applied policies.
  - Solving compliance and security challenges once.
- Group analytics, data integrations and products into Data Landing Zone(s)
- In case of multiple Data Landing Zones subscriptions:-
  - Simplification of communication over peer to peer
  - Scale using subscriptions of Data Landing Zone
  - Customizable and reusable deployment templates
- Organizational guidance to maintain security boundaries.

# Data Management Landing Zone

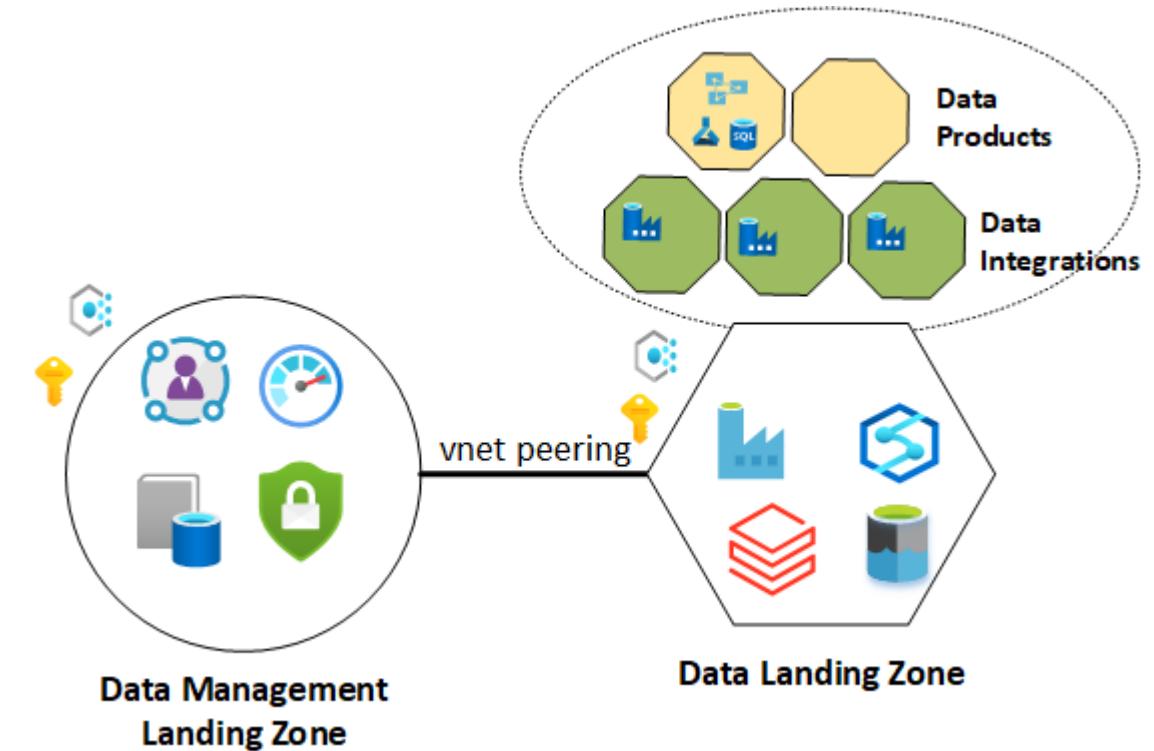

# Data Landing Zone

# Enterprise Scale Analytics Option I

## Single Data Landing Zone

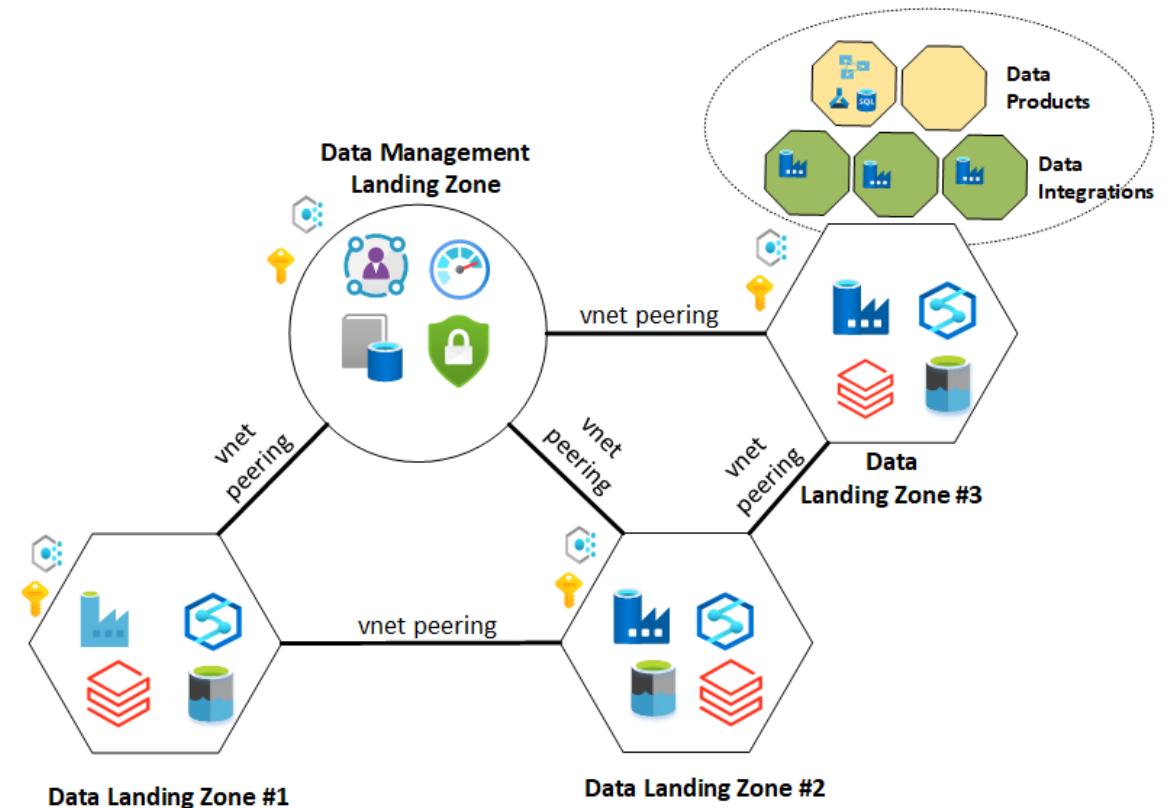

- Central Data Office and no business Data offices
- Enable Self Service Reporting

# Enterprise Scale Analytics Option II

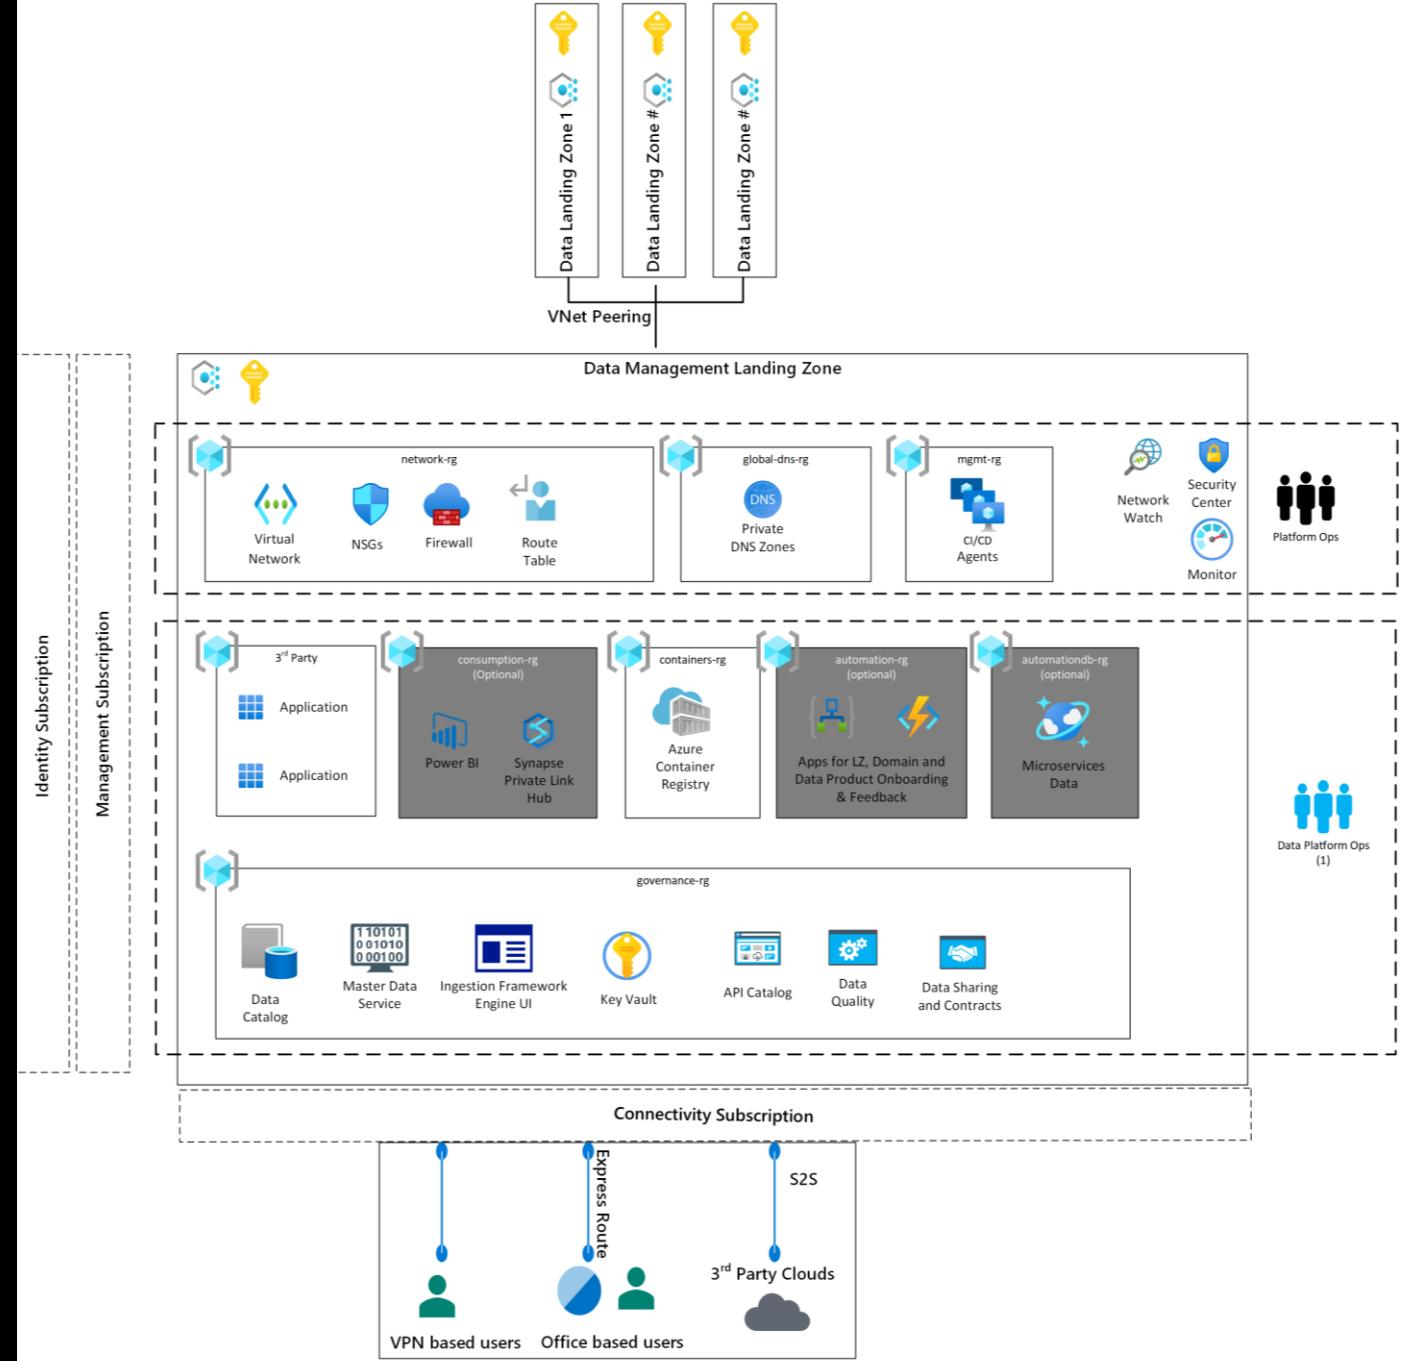

## Multiple Data Landing Zones

- Multi Subscription
- Multiple Data Landing Zone Subscriptions
- Business Driven
- Combination of Central and Business Data Offices
- Example:
  - Car Group Holding company with multiple divisions.
  - Each car brand would have their own data landing zone
  - One Data Management Landing Zone
